What is this Xerox directory doing in Program Files?

November 16, 2004

Raymond Chen

If you go snooping around, you may find an empty `C:\Program Files\Xerox` directory. What's that for?

This directory is being watched by Windows File Protection, because it needs to protect the file `xrxflnch.exe` should it ever show up. (Why does the directory have to exist in order for Windows File Protection to be able to watch it? I'm told it's a limitation of the Windows File Protection engine. I suspect it may have something to do with the fact that the `FindFirstChangeNotification` function can't watch a directory that doesn't exist.)

Why is `xrxflnch.exe` so special? I don't know. My guess is that it's some file that is frequently overwritten by setup programs and therefore needs to be protected.
