Raymond Chen

The episode of the television documentary *CSI: Cyber* which aired on CBS last Wednesday demonstrated an elite trick to obtaining a hacker's IP address: Extract it from the email header.

Here's a screen shot from time code 14:35 that demonstrates the technique.

```
<meta id="viewport" content="" name="viewport"></m
<link href="y/images/favicon.ico" rel="shortcut ic
<link href="y/styles.css?s=1382384360" type="text/
<link href="y/mail.css?s=1382384360" type="text/cs
<hidden: ip: 951.27.9.840 > < echo;off;>
<!--if lte IE 8><link rel="stylesheet" type="text/
<!--if lte IE 7><link rel="stylesheet" type="text/
<link href="plugins/jqueryui/themes/larry/jquery-u
<link href="plugins/jqueryui/themes/larry/ui.js?s=
```

This technique is so awesome I had to share it.
