

How do I create a wizard that contains none of the things that makes a wizard a wizard?

A customer asked

We're using the `PropertySheet` function to create a wizard. We've been able to remove almost all of the wizard elements, but we can't figure out how to get rid of the footer area. Is there a way to get rid of that?

The customer included a picture of what they were talking about, with the offending area highlighted:

Um, that footer area is where the Back/Next buttons go. If you remove the navigation buttons, then what you have isn't really a wizard any more.

What you've got there is a dialog box.

So use a dialog box.

You've ordered a cheeseburger and are trying to remove every last bit of cheese. Don't do that. Just order a hamburger if that's what you want.
