Background

The threat actors were seen using Windows Management Instrumentation (WMI) to transfer the following three files (and execute `usysdiag.exe`) to each machine by executing a script that targeted a list of local IP addresses:

- `usysdiag.exe`
- `sensapi.dll`
- `usysdiag.exe.dat`

Analysis

The `usysdiag.exe` (**Huorong Sysdiag Helper - Huorong Internet Security**) which is a valid signed executable by "**Beijing Huorong Network Technology Co. Ltd.**" - **Chinese endpoint security solutions provider** is initially executed.

The `usysdiag.exe` calls a function which calls **LoadLibraryA()** to load "**sensapi.dll**" in its virtual address space and then calls **GetProcAddress()** function to fetch address to the `IsNetworkAlive()` function exported by "**sensapi.dll**".

But in our case, the **NailaoLoader** "sensapi.dll" is been **side-loaded** instead of the legitimate DLL as it is present alongside the "usysdiag.exe" in the same directory and then once the NailaoLoader DLL is loaded the **DllMain()** function of the malicious DLL is called.

The NailaoLoader's **DllMain()** function initially calls **GetModuleHandleW()** with **lpModuleName = NULL** which retrieves the handle (**image base address - eg. 0x00007FF69CD50000**) of the calling process "usysdiag.exe" and then it verifies a bytes sequence at a specific offset in the **.text** section of usysdiag.exe. Following is the byte sequence which is verified:

- At <usysdiag_image_base_address> + 0x1008F + 0x10 compares byte: 0x8B
- At <usysdiag_image_base_address> + 0x1008F + 0x11 compares byte: 0xC8
- At <usysdiag_image_base_address> + 0x1008F + 0x12 compares byte: 0xFF
- At <usysdiag_image_base_address> + 0x1008F + 0x13 compares byte: 0x15

The **NailaoLoader** in this case checks for the following instructions `mov ecx, eax ; call qword ptr (8B C8 FF 15)` at the given offset and interestingly the offset into the `usysdiag's` .text section is basically in the same initial function itself which called the **LoadLibraryA()** to load "**sensapi.dll**".

FF15 71F20300	<code>call qword ptr ds:[<LoadLibraryA>]</code>
48:8BD8	<code>mov rbx,rax</code>
48:85C0	<code>test rax,rax</code>
74 61	<code>je usysdiag.7FF69CD600F8</code>
48:8D15 0ADF0400	<code>lea rdx,qword ptr ds:[7FF69CDADFA8]</code>
48:8BC8	<code>mov rcx,rax</code>
FF15 79F20300	<code>call qword ptr ds:[<GetProcAddress>]</code>

If the byte sequence does not match the **DllMain()** returns and the **NailaoLoader** does not execute the malicious code. Therefore the following executable "**usysdiag.exe**" is required in order to execute the malicious code of the **NailaoLoader**.

Further if the bytes match then it performs following actions:

calls the **ret_virtual_protect_addr()** function which returns the address of **VirtualProtect()** function by firstly allocating a 100 byte buffer and then performing `cus_memcpy()` to copy the string "VirtualProtect" byte by byte into the allocated buffer.

```

call    alloc_mem
lea     r8, aV          ; "V"
mov     edx, 100h
lea     rcx, [rsp+138h+ProcName]
call    mem_cpy
lea     r8, aI          ; "i"
mov     edx, 100h
lea     rcx, [rsp+138h+ProcName]
call    mem_cpy
lea     r8, aR          ; "r"
mov     edx, 100h
lea     rcx, [rsp+138h+ProcName]
call    mem_cpy
lea     r8, aT          ; "t"
mov     edx, 100h
lea     rcx, [rsp+138h+ProcName]
call    mem_cpy
lea     r8, aU          ; "u"
mov     edx, 100h
lea     rcx, [rsp+138h+ProcName]
call    mem_cpy
lea     r8, aA          ; "a"
mov     edx, 100h
lea     rcx, [rsp+138h+ProcName]
call    mem_cpy
lea     r8, asc_180017894 ; "l"
mov     edx, 100h
lea     rcx, [rsp+138h+ProcName]
call    mem_cpy
lea     r8, aP          ; "p"
mov     edx, 100h
lea     rcx, [rsp+138h+ProcName]
call    mem_cpy
lea     r8, aR          ; "r"
mov     edx, 100h
lea     rcx, [rsp+138h+ProcName]
call    mem_cpy
lea     r8, aO          ; "o"
mov     edx, 100h
lea     rcx, [rsp+138h+ProcName]
call    mem_cpy
lea     r8, aT          ; "t"
mov     edx, 100h
lea     rcx, [rsp+138h+ProcName]
call    mem_cpy
lea     r8, aE          ; "e"
mov     edx, 100h
lea     rcx, [rsp+138h+ProcName]
call    mem_cpy
lea     r8, aC          ; "c"
mov     edx, 100h
lea     rcx, [rsp+138h+ProcName]
call    mem_cpy
lea     r8, aT          ; "t"

```

Then it calls **GetModuleHandleA()** where **lpModuleName = kernel32** to get the handle to **kernel32.dll** and then calls **GetProcAddress()** with the handle to kernel32.dll and **lpProcName** as **VirtualProtect** to get the address of **VirtualProtect()** and returns the address

to it.

Then it calls the **VirtualProtect()** function to change the page protection to **PAGE_READWRITE** of the memory region in usysdiag.exe's .text section which consists of the **initial function which called LoadLibraryA() to load "sensapi.dll"**

NOW in order to execute the **load_decrypt_exec_locker_func()** function which is the main function which **reads the encrypted usysdiag.exe.dat file from the disk, decrypts it using a XOR key and then maps the decrypted NailaoLocker binary in memory and transfers the control flow to the binary's entrypoint.**

The **NailaoLoader** patches the following instructions which are just after the call to **LoadLibraryA("sensapi.dll")** in the initial function that we say was called by usysdiag.exe when executed.

```
mov rbx, rax
test rax, rax
```

Patched to:

```
mov rax, sensapi.7FFA8D1E1DF0 [address of load_decrypt_exec_locker_func() function]
call rax
```

If we compare both the unpatched and patched versions of the initial function called by usysdiag.exe calling the **LoadLibraryA()** to load **Sensapi.dll** we can clearly see the difference:

Function Before Patching:

00007FF69CD60078	48:895C24 50	mov qword ptr ss:[rsp+50],rbx	
00007FF69CD6007D	48:8D0D 14DF0400	lea rcx,qword ptr ds:[7FF69CDADF98]	00007FF69CDADF98:"sensapi.dll"
00007FF69CD60084	48:897C24 40	mov qword ptr ss:[rsp+40],rdi	
00007FF69CD60089	FF15 71F20300	call qword ptr ds:[<LoadLibraryA>]	
00007FF69CD6008F	48:8BD8	mov rbx,rax	
00007FF69CD60092	48:85C0	test rax,rax	
00007FF69CD60095	74 61	je usysdiag.7FF69CD600F8	un-patched instructions
00007FF69CD60097	48:8D15 0ADF0400	lea rdx,qword ptr ds:[7FF69CDADFA8]	00007FF69CDADFA8:"IsNetworkAlive"
00007FF69CD6009E	48:8BC8	mov rcx,rax	
00007FF69CD600A1	FF15 79F20300	call qword ptr ds:[<GetProcAddress>]	
00007FF69CD600A7	48:8BF8	mov rdi,rax	
00007FF69CD600AA	48:85C0	test rax,rax	
00007FF69CD600AD	74 49	je usysdiag.7FF69CD600F8	

Function After Patching:

00007FF69CD60078	48:895C24 50	mov qword ptr ss:[rsp+50],rbx	
00007FF69CD6007D	48:8D0D 14DF0400	lea rcx,qword ptr ds:[7FF69CDADF98]	00007FF69CDADF98:"sensapi.dll"
00007FF69CD60084	48:897C24 40	mov qword ptr ss:[rsp+40],rdi	
00007FF69CD60089	FF15 71F20300	call qword ptr ds:[<LoadLibraryA>]	
00007FF69CD6008F	48:B8 F0D1E8DFA7F000	mov rax,sensapi.7FA8D1E1DF0	
00007FF69CD60099	FFD0	call rax	patched instructions
00007FF69CD6009B	DF0400	fld word ptr ds:[rax+rax]	
00007FF69CD6009E	48:8BC8	mov rcx,rax	
00007FF69CD600A1	FF15 79F20300	call qword ptr ds:[<GetProcAddress>]	Addr of load_decrypt_exec_locker_func()
00007FF69CD600A7	48:8BF8	mov rdi,rax	
00007FF69CD600AA	48:85C0	test rax,rax	
00007FF69CD600AD	74 49	je usysdiag.7FF69CD600F8	

Disassembled code of NailaoLoader patching the instructions:

```

movzx  eax, byte ptr [rsp+48h+var_20+1]
movzx  edx, byte ptr [rsp+48h+var_20+5]
mov     word ptr [rbx], 0B848h
mov     [rbx+3], al
movzx  eax, byte ptr [rsp+48h+var_20+2]
mov     [rbx+4], al
movzx  eax, byte ptr [rsp+48h+var_20+3]
mov     [rbx+7], dl
movzx  edx, byte ptr [rsp+48h+var_20+6]
mov     [rbx+5], al
movzx  eax, byte ptr [rsp+48h+var_20+4]
mov     [rbx+8], dl
movzx  edx, byte ptr [rsp+48h+var_20+7]
mov     [rbx+6], al
mov     [rbx+2], sil
mov     [rbx+9], dl
mov     word ptr [rbx+0Ah], 0D0FFh

```

So now whenever the **LoadLibraryA()** function trying to load the "sensapi.dll" ;) returns the next instruction called would be the patched instructions which will move the address of **load_decrypt_exec_locker_func()** function into **rax** and then call **rax** i.e call the **load_decrypt_exec_locker_func()** function

This technique helps in hiding the execution flow of the Loader as the load-decrypt-execute function is not called from the malicious NailaoLoader DLL itself.

Then it again calls **VirtualProtect()** and sets the page protection of the same memory region of the .text section to **PAGE_EXECUTE_READ** (back to the old page protection) and then returns from the **DllMain()** of the sensapi.dll.

Further when the **LoadLibraryA("sensapi.dll")** function called by usysdiag.exe returns back it then executes the patched instructions and calls the **load_decrypt_exec_locker_func()** which then further executes the **NailaoLocker!**

```
mov rax,sensapi.7FFA8D1E1DF0 [addr of load_decrypt_exec_locker_func() function]  
call rax
```

This is how the NailaoLoader hides the Execution Flow via Patching Instructions in order to run the load-decrypt-execute function which further executes the NailaoLocker.
