

A Deep-dive Analysis of KARMA Ransomware

blog.cyble.com/2021/08/24/a-deep-dive-analysis-of-karma-ransomware/

August 24, 2021

While performing our routine Open-Source Intelligence (OSINT) research, Cyble Research Labs came across a ransomware group known as KARMA, which encrypts files on the victim's machine and appends the extension of encrypted files to `.KARMA`. Subsequently, the Threat Actors (TAs) demand that the victims pay ransom for the private key to recover their data.

Based on analysis by Cyble Research Labs, we have observed that the executable payload is a console-based application.

Figure 1 shows the execution flow of the Karma ransomware. After execution, the malware takes inputs from the user and checks all A-Z drives, excludes folders and files from encryption. After this, the ransomware proceeds to drop the ransom note and replaces the original content with encrypted content. It then appends the extension as `.KARMA`.

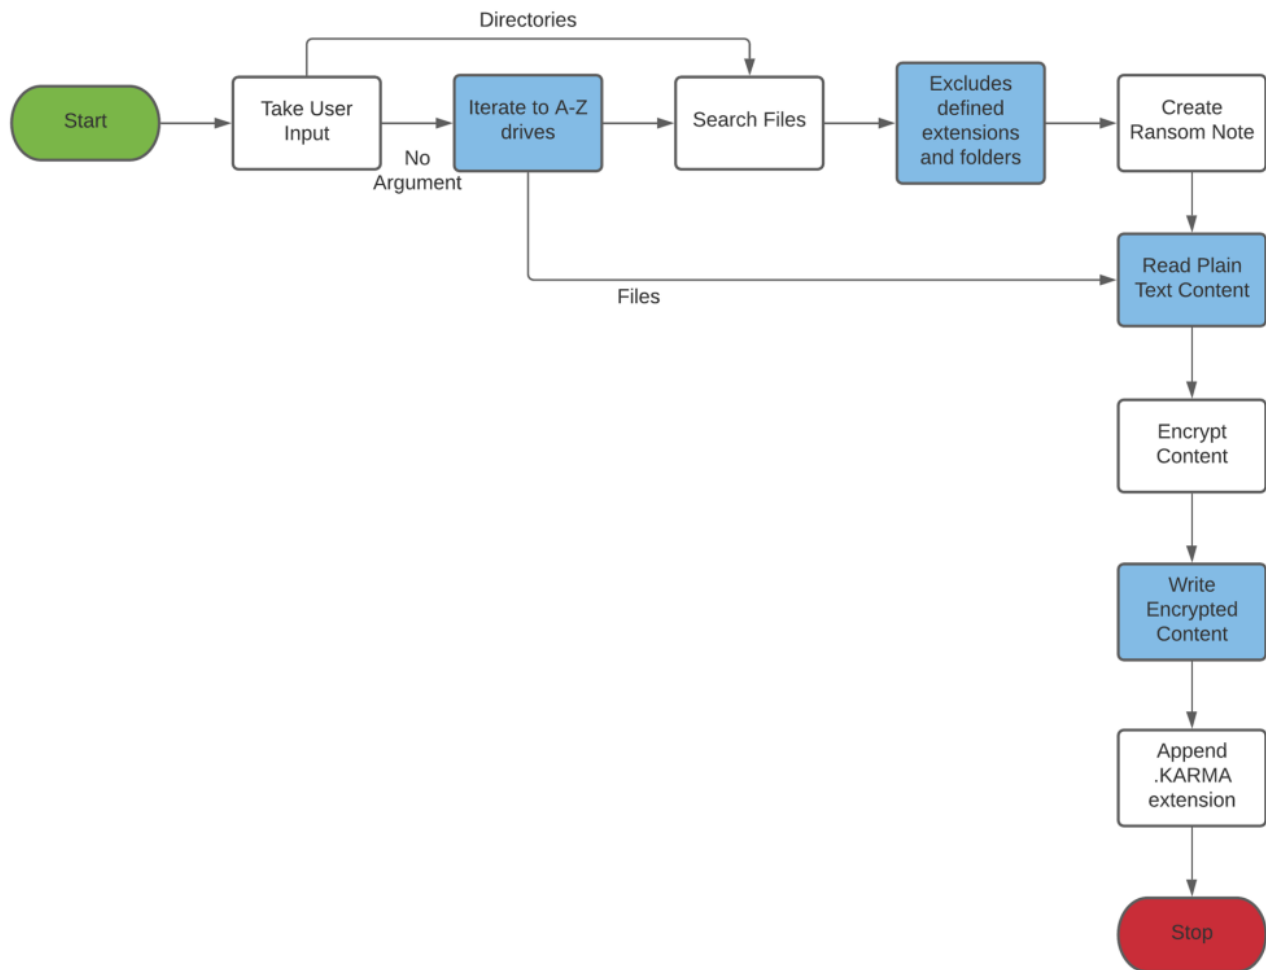

Figure 1 Execution Flow of Karma Ransomware

Technical Analysis

Our static analysis found that the malware is a console-based x86 architecture executable written in C/C++, as shown in Figure 2.

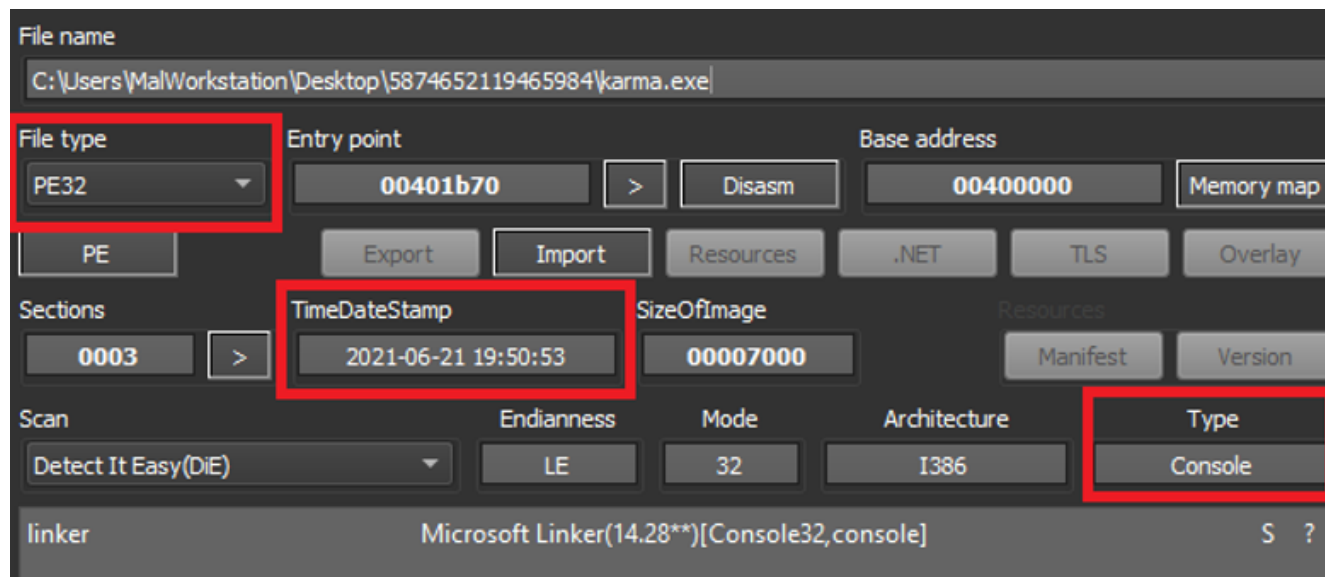

Figure 2 Malware Payload Static Information

After encrypting the files, the ransomware payload drops the ransom note named *KARMA-ENCRYPTED.txt* in various places in the victim's machine, as shown in Figure 3.

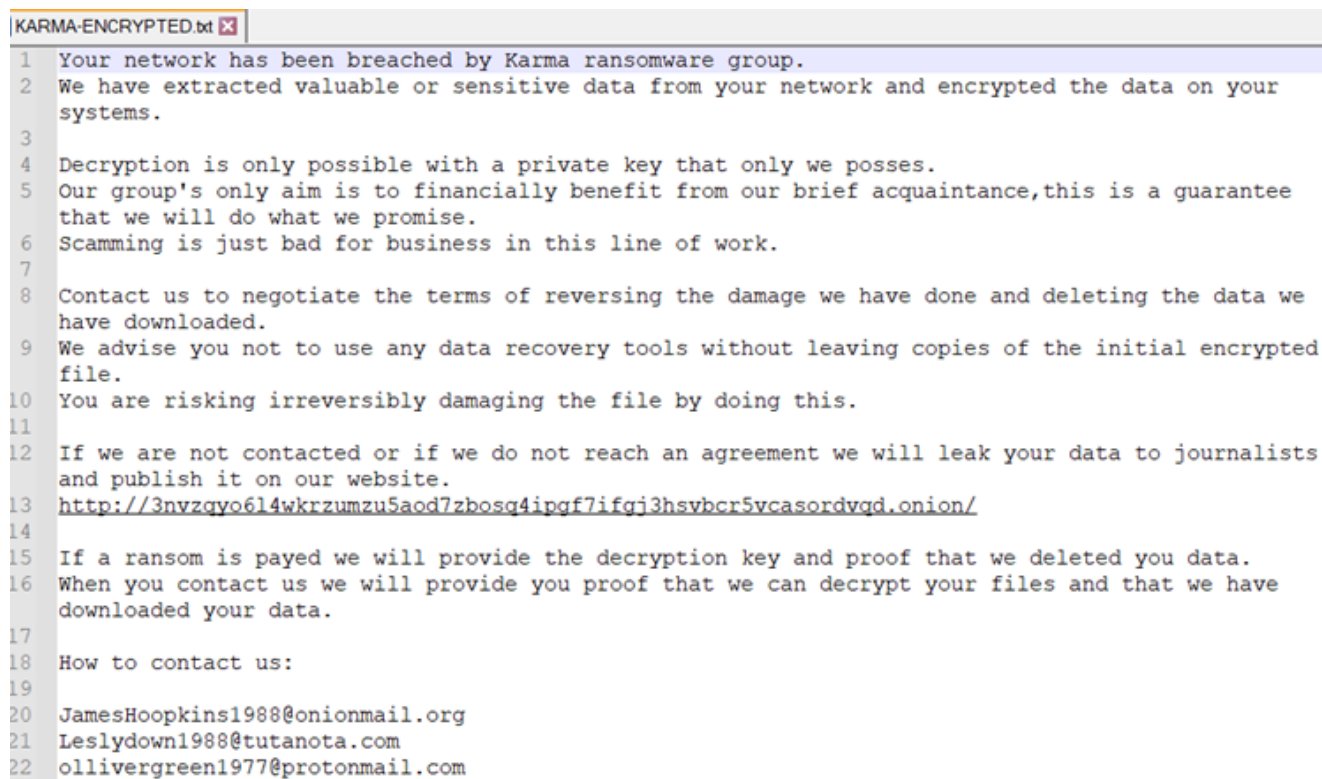

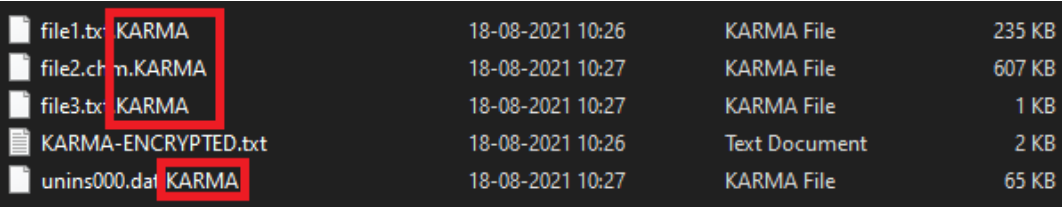

Figure 3 Ransom Note

In the above ransom note, the TAs have given email support IDs " [JamesHoopkins1988@onionmail\[.\]org](mailto:JamesHoopkins1988@onionmail.org) , [Leslydown1988@tutanota\[.\]com](mailto:Leslydown1988@tutanota.com) , "

[ollivergreen1977@protonmail\[.\]com](mailto:ollivergreen1977@protonmail[.]com)". The victims are asked to reach out to the attackers and pay the ransom amount in Bitcoin (BTC) to get the private decryption key.

After execution, the malware encrypts the files and appends the extension of encrypted files as `.KARMA` and drops ransom note as shown in Figure 4.

file1.txt	KARMA	18-08-2021 10:26	KARMA File	235 KB
file2.chm	KARMA	18-08-2021 10:27	KARMA File	607 KB
file3.txt	KARMA	18-08-2021 10:27	KARMA File	1 KB
KARMA-ENCRYPTED.txt		18-08-2021 10:26	Text Document	2 KB
unins000.dat	KARMA	18-08-2021 10:27	KARMA File	65 KB

Figure 4 Encrypted

Files

Upon execution, a Mutex with the name `KARMA` is created to ensure that only one instance of this ransomware is running at a time, as shown in Figure 5.

```
v8 = GetStdHandle(0xFFFFFFFF);
WriteConsoleW(v8, Buffer, v13, 0, 0);
CreateMutexA(0, 0, "KARMA");
result = GetLastError();
if ( result != 183 )
{
    dword_406000 = sub_402270();
    sub_4021A0(L"[+] Getting argument list...", 0);
    v10 = GetCommandLine();
    v11 = sub_402060(v10, &v16);
    v12 = v11;
    if ( v16 <= 1 )
    {
        sub_401DE0():
```

Figure 5 Malware Creates Mutex

The malware payload uses the `crypt32.dll` library, a module used to implement certificate and cryptographic messaging functions in the CryptoAPI, as shown below.

```
v32 = 0x10000000;
v15 = GetProcessHeap();
v16 = (BYTE *)HeapAlloc(v15, 0, v32);
v17 = hModule;
v18 = v16;
dword_406004 = (int)v16;
if ( !hModule )
{
    v17 = LoadLibraryA("crypt32.dll");
    hModule = v17;
```

Figure 6 Malware Loads Library `crypt32.dll`

As shown in Figure 7, the malware payload first gets the command-line string and checks if the argument is less or equal to 1. It then creates threads depending on the logical drive present in the victim machine.

If the argument is greater than 1, the malware checks whether the passed argument is a directory.

If a directory is found, the payload encrypts the directory and its content. Furthermore, if the argument is for any specific file, the malware will start encrypting that file as well.

```

Print((int)L"[+] Getting argument list...", 0);
CommandLineW = (__int16 * GetCommandLine());
path_to_specific_directory_or_file = sub_402060(CommandLineW, &lenght_of_argument);
path_to_specific_directory_or_file_2 = (int)path_to_specific_directory_or_file;
if ( lenght_of_argument <= 1 )
{
ptr_func_ransome_note(a1, a2, (int)path_to_specific_directory_or_file);
Print((int)L"[+] Starting all threads...", 0);
sub_403140();
}
else
{
Print((int)L" [-] Argument: ", (__int16 *)path_to_specific_directory_or_file[1]);
if ( check_if_passed_argument_is_directory(*(LPCWSTR *) (path_to_specific_directory_or_file_2 + 4)) )
{
ptr_func_ransome_note(a1, a2, path_to_specific_directory_or_file_2);
sub_401D00((int)Buffer, *(_DWORD *) (path_to_specific_directory_or_file_2 + 4));
sub_401D20(Buffer, L"\\");
Print((int)L"[+] Encrypting directory: ", Buffer);
sub_402A80(Buffer);
}
else
{
ptr_func_ransome_note(a1, a2, path_to_specific_directory_or_file_2);
Print((int)L"[+] Encrypting file: ", *(__int16 **)(path_to_specific_directory_or_file_2 + 4));
func_to_check_enc_write_read(*(LPCWSTR *) (path_to_specific_directory_or_file_2 + 4));
}
}
ExitProcess(0);

```

Figure 7 Malware Encryption Process

The malware payload iterates through all possible A-Z drives on the Windows machine and verifies if the drives are logical, after which it creates a thread. Refer to Figure 8.

```

v0 = 0;
for ( i = 0; i < 26; ++i )
{
v10 = '\\\\0:.';
RootPathName = i + 'A';
v11 = 0;
DriveTypeW = GetDriveTypeW(&RootPathName);
ProcessHeap = GetProcessHeap();
v4 = (char *)HeapAlloc(ProcessHeap, 0, 4u);
v5 = DriveTypeW - 2;
if ( v5 )
{
v6 = v5 - 1;
if ( v6 )
{
if ( v6 != 1 )
continue;
}
}
*(_WORD *)v4 = RootPathName;
*(_DWORD *) (v4 + 2) = v10;
*(_WORD *) (v4 + 3) = v11;
hHandle[v0] = CreateThread(0, 0, StartAddress, v4, 0, 0);
Sleep(0x1r4u);
++v0;
}

```

Figure 8 Malware Verifies the Windows Drives and Creates Thread

The malware excludes the list of folders shown in Table 1 from the encryption routine as shown in Figure 9.

Folders
All Users
Program Files
Program Files x86
Windows
Recycle bin

```

ta:00404368 word_404368 dw a' ; DATA XREF: sub_402A80:loc_4

```

Figure 10 Malware Excludes Files from Encryption

The malware initially searches for folders, for example, *config.Msi* in C drive. If it can successfully locate these folders, it performs further actions, as shown in Figure 11.

00402E96	66:85C0	test ax,ax	
00402E99	75 F5	jne karmasde.402E90	
00402E9E	83E9 04	sub ecx,4	ecx:L"Config.Msi\\"
00402E9E	66:90	nop	
00402EA0	0FB702	movzx eax,word ptr ds:[edx]	edx:L"36897c.rbf.KARMA"
00402EA3	8D49 02	lea ecx,dword ptr ds:[ecx+2]	ecx:L"Config.Msi\\", ecx+2:L"onfig.Msi\\"
00402EA6	66:8901	mov word ptr ds:[ecx],ax	ecx:L"Config.Msi\\"
00402EA9	8D52 02	lea edx,dword ptr ds:[edx+2]	edx:L"36897c.rbf.KARMA", edx+2:L"6897c.rbf.KARMA"

Figure 11 Malware Searches for the Folder

After finding the required folders, the malware creates the ransom note, as shown in Figure 12.

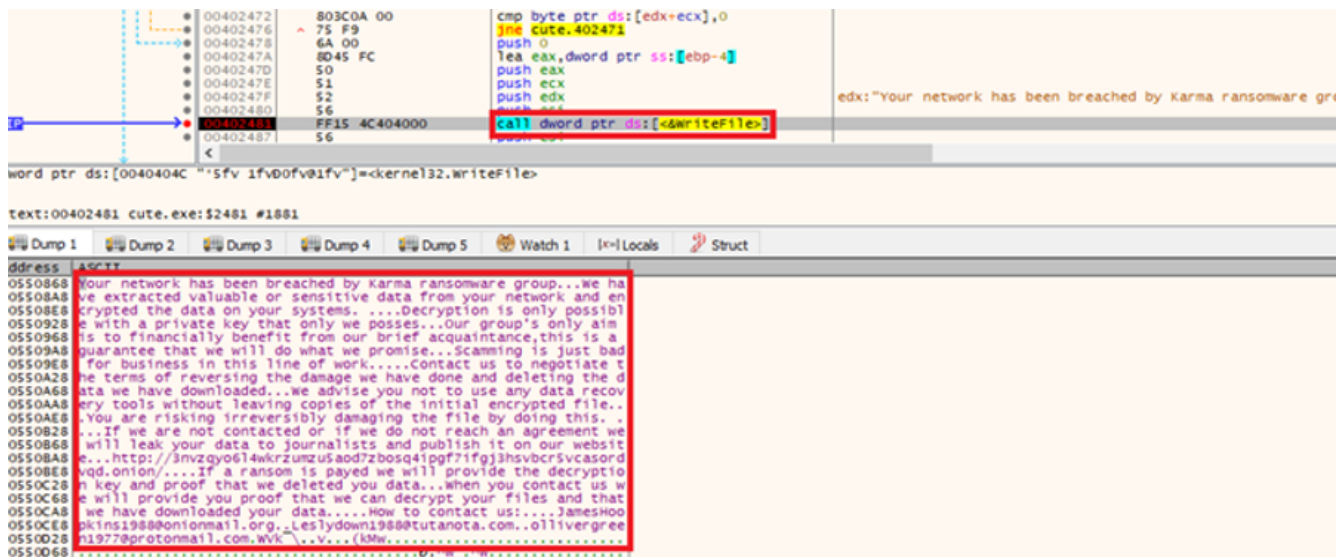

Figure 12 Malware Writes Ransom Note

As seen in Figure 13, the malware generates a seed after creating the ransom note.

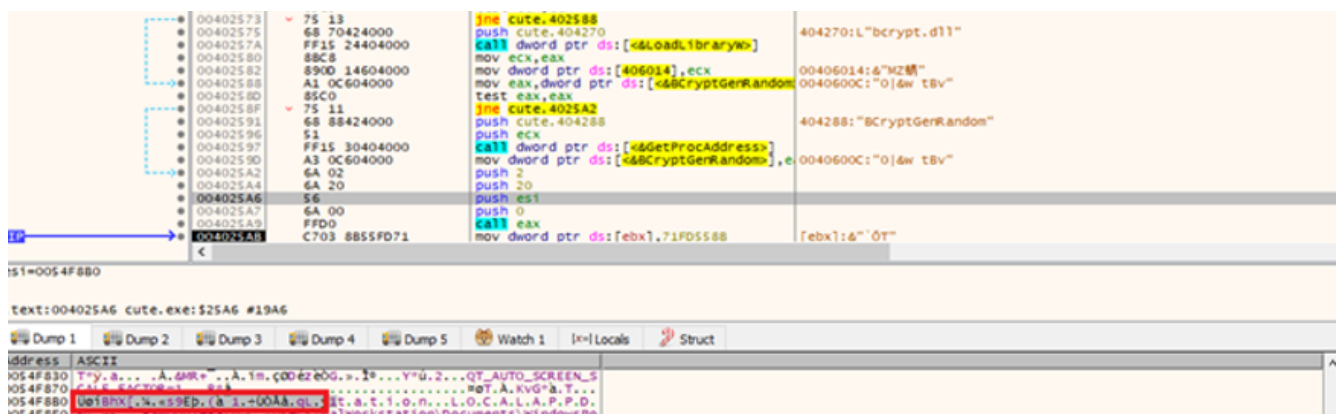

Figure 13 Malware Generates Seed

The malware reads the content and writes encrypted data, as shown in Figure 14.

```

WriteFile(v2, lpBuffer, v33, &NumberOfBytesWritten, 0);
HighPart = FileSize.HighPart;
LowPart = FileSize.LowPart;
if ( FileSize.QuadPart <= 1200000 )
{
    v71 = FileSize.LowPart;
    v62 = GetProcessHeap();
    v63 = HeapAlloc(v62, 0, v71);
    liDistanceToMove.QuadPart = 0i64;
    SetFilePointerEx(hFile, 0i64, 0, 0);
    ReadFile(hFile, v63, FileSize.LowPart, &NumberOfBytesRead, 0);
    sub_4035D0((int *)lpMem, v64, (int)v63, FileSize.LowPart);
    v2 = hFile;
    SetFilePointerEx(hFile, 0i64, 0, 0);
    WriteFile(hFile, v63, FileSize.LowPart, &NumberOfBytesWritten, 0);
    v65 = GetProcessHeap();
    HeapFree(v65, 0, v63);
}

```

Figure 14 Malware Reads the Content and Writes Encrypted Content

Figure 15 shows the encryption routine performed by the malware.

```
int __cdecl sub_4035D0(int *a1, int a2, int a3, unsigned int a4)
```

```
int v4; // ecx
_OWORD *v5; // edx
int v6; // ecx
unsigned int v7; // esi
char v9[64]; // [esp+0h] [ebp-54h] BYREF
int v10[2]; // [esp+40h] [ebp-14h] BYREF
__int64 v11; // [esp+48h] [ebp-Ch]
_OWORD *v12; // [esp+50h] [ebp-4h]

v5 = (_OWORD *)v4;
v12 = (_OWORD *)v4;
v11 = 0i64;
if ( !v4 || !a1 || !a3 )
    return 1;
v6 = a1[1];
v7 = 0;
v10[0] = *a1;
for ( v10[1] = v6; v7 < a4; ++v7 )
{
    if ( (v7 & 0x3F) == 0 )
    {
        LOBYTE(v11) = v7 >> 6;
        BYTE1(v11) = v7 >> 14;
        BYTE2(v11) = v7 >> 22;
        BYTE3(v11) = v7 >> 30;
        sub_403480(v5, (char *)v10, (int)v9);
        v5 = v12;
    }
    *(_BYTE *)(v7 + a3) ^= v9[v7 & 0x3F];
}
return 0;
```

Figure 15 Encryption Routine

After encrypting the files, the malware replaces the original content with encrypted content with appended extension as *.KARMA*, as shown in Figure 16.

Figure 16 Malware Replaces Original Content with Encrypted Content

The TOR website [http://3nvzqyo6l4wkrzumzu5aod7zbosq4ipgf7ifgj3hsvbcr5vcasordvqd\[.\]onion/](http://3nvzqyo6l4wkrzumzu5aod7zbosq4ipgf7ifgj3hsvbcr5vcasordvqd[.]onion/) shown in Figure 17 was present in the ransom note, in the contact section of the website, TAs have mentioned two email IDs jeffreyclinton1977@onionmail.org and jackiesmith176@protonmail.com, which the victims can use to communicate with them to recover the data

Conclusion

Ransomware groups continue to pose a severe threat to firms and individuals. Organizations need to stay ahead of the techniques used by TAs, besides implementing the requisite security best practices and security controls.

Ransomware victims are at risk of losing valuable data as a result of such attacks, resulting in financial loss and lost productivity. In the event that the victim is unable or unwilling to pay the ransom, the TA may leak or sell this data online. This will not only compromise sensitive user data in the case of banks, online shopping portals etc, but it will also lead to a loss of reputation for the affected firm.

Cyble Research Lab is continuously monitoring KARMA's extortion campaign and will keep our readers up to date with new information.

Our Recommendations

We have listed some essential cybersecurity best practices that create the first line of control against attackers. We recommend that our readers follow these suggestions given below:

- Conduct regular backup practices and keep those backups offline or on a separate network.
- Regularly perform the vulnerability assessment of the organizational assets majorly which are exposed on internet.
- Refrain from opening untrusted links and email attachments without verifying their authenticity.
- Avoid using software cracks or keygens from torrent or third-party servers.
- Use strong passwords and enforce multi-factor authentication wherever possible.
- Turn on the automatic software update feature on your computer, mobile, and other connected devices wherever possible and pragmatic.
- Use a reputed anti-virus and Internet security software package on your connected devices, including PC, laptop, and mobile.

About Us

[Cyble](#) is a global threat intelligence SaaS provider that helps enterprises protect themselves from cybercrimes and exposure in the Darkweb. Its prime focus is to provide organizations with real-time visibility to their digital risk footprint. Backed by Y Combinator as part of the 2021 winter cohort, Cyble has also been recognized by Forbes as one of the top 20 Best Cybersecurity Start-ups To Watch In 2020. Headquartered in Alpharetta, Georgia, and with offices in Australia, Singapore, and India, Cyble has a global presence. To learn more about Cyble, visit <https://cyble.com>.
